And in accordance with law, and an order of the Board of Trustees made on the 11th day of January, 1865, so many shares of each parcel of said stock as may be necessary will be sold at the salesroom of Cobb & Sinton, No. 406 Montgomery street, San Francisco, on Monday, the 13th day of March, 1865, at the hour of 12 o'clock M., of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale.

W. FELL, Secretary.

Office, No. 63 Montgomery Block, San Francisco. 7v10

Mammoth Gold and Silver Mining Company, Silver Mountain District, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 12th day of December, 1864, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, or to H. D. Scott, Superintendent, at Silver Mountain.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 1st day of April, 1865, to pay the delinquent assessment, together with costs of Advertising and exponses of the Sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

Office, No. 430 Montgomery street (Room No. 5, up stairs), San Francisco.

Notice.—On account of errors in previous proceedings, the above assessment notice is published anew, and stockholders who have paid on the previous notice will be credited accordingly.

7v10 J. WARREN CLARK, Secretary.

Mina Prieta Silver Mining Company, District of Ures, Sonora, Mexico.

☞ All persons are hereby cautioned against purchasing any of the following described stock, sold February 6, 1865, for delinquent assessment No. 29 (levied December 20, 1864,) and expenses, as said stock will not be transferred on the books of the Company—viz:

In the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco.

Jane E. Lykins, Plaintiff, vs. Isaac N. Lykins, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk,
By G. C. Letcher, Deputy Clerk.
C. Sims, Attorney for Plaintiff. 7v10-3m

The North Sea is valued at twenty cents an acre for fishing purposes.

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire Gold of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and Londoa.

The Golden Era is now enlarged by the addition of eigh columns to its pages—and presents fifty six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day are published as Serials, from week to week, in The Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the Golden Era are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished talent in the Atlantic States and Europe; including "Orpheus C. Kerr," Fitz Hugh Ludlow, G. B. Densmore, "Mark Twain," Dan De Quille, Florence Fane, Miss Emma Hardinge, Sarah E. Carmichael, Annie E. Fitzgerald, "Occasia Owen," Alice Mason, William Simpson, Chas. F. Stoddart, "Ina," H. C. Williston, "Albion," "Fairfax," Bonnevel, Mary Kyle Dallas, Margaret Hosmer, and many other accomplished writers of Fiction, Romance, Novels and Stories, Poetry, Essays, Sketches, etc., etc., comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

Subscriptions to be Paid in Advance.

ONE YEAR $4. SIX MONTHS $2. THREE MONTHS $1.

Take care to write distinctly the name of the person; the name of the city, town or locality where the Post office is situated, and the name of the County and State, in order that the paper may be fully and accurately directed to every address.

THE GOLDEN ERA TO CLUBS.

Parties (living remote from localities where agents are located) forming a club of five yearly or half-yearly subscribers, and forwarding the subscriptions (by letter registered and postage paid) to the office of publication in San Francisco, will be entitled to an additional copy of The Golden Era for the term of one year, or to retain the equivalent in cash.

AGENTS in every part of the State receive subscribtions or the Golden Era.

POSTMASTERS in California, Oregon, and neighboring Territories, obtaining subscriptions for the Golden Era and forwarding the same, with name and address of the subscriber, will be allowed a commission therefor.

PARTIES residing in localities where no Agents are established will forward their subscriptions by mail.

SUBSCRIBERS will be careful in writing as plainly and fully as possible, the direction of papers to be sent to any part of California, the Atlantic States, or elsewhere.

Now is the Time to Subscribe.

TO ADVERTISERS!

Best Advertising Medium—The "Golden Era" is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village, and mining and agricultural precinct in California, and offers unusual and unequaled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

GOLDEN ERA POSTAGE:

Postage on the GOLDEN ERA, to Mail Subscribers, in California and throughout all the States and Territories of the Union, per quarter, (3 months).... 5 cts. To be paid quarterly, in advance, either at the Office of Mailing or Delivery.

Postage on the GOLDEN ERA, Single Copies, transient, to be prepaid by stamps..... 2 cts.

Postage on the GOLDEN ERA, to Mail Subscribers in the county (San Francisco) where published..... Free.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Correct blank forms for advertising, and any information desired by advertisers, will be furnished, gratuitously, at the office of the Mining and Scientific Press.

Black Rock Ledge Silver Mining Company, Reese River Mining District, Lander County, Nevada.

Notice is hereby given that there will be a meeting of the Stockholders of the above the Company, at the office of the Secretary, on the 18th day of February, 1865, at one o'clock P. M., for the purpose of electing Trustees, and such other business as may come before the meeting.

J. E. PURDY, Secretary.

Office, Room No. 7, N. W. corner Front and Clay streets, San Francisco. 3

Black Rock Ledge Silver Mining Company, Reese River Mining District, Lander County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 20th day of November, 1864, an Assessment (No. 4) of $3 per share was levied upon the capital stock of said Company, (and owing to a defect in the publication of the delinquent sale, the proceedings are this day, January 21st, ordered re-published) and and the same is hereby made payable, in United States gold coin, on or before the 25th day of February, 1865, to the Secretary, at his office, or to Wm. Adams, Superintendent, at Austin, Nevada.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 25th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday the 11th day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. E. PURDY, Secretary.

Office, Room No. 7, N. W. Corner Front and Clay streets, San Francisco. Cal. ja21-3-4

Chipiopena Mining Company, District of Ures, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 3d day of February, 1865, an assessment of two ($2) dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 313 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 11th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday the 25th day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

feb4-5-4 JOHN F. LOHSE, Secretary.

Copp Gold and Silver Mining Company, Sierra District, Humboldt County, Nevada

Notice.—There are delinquent upon the following described stock, on account of Assessment levied on the 20th day of August, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

S. C. GARDNER, Secretary.

Office, at Bemis & Edson's, (who are authorized to receive and receipt for assessments due as above) No. 16 Drum st., between California and Sacramento streets, San Francisco. feb11-6

Postponement.—The above sale is hereby postponed until Monday, March 6th, 1865, at the same place and hour. By order of the Board of Trustees.

7v10 S. C. GARDNER, Secretary.

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the Mining and Scientific Press. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

La Libertad Gold and Silver Mining Company, Cacachillas District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 25th day of January, 1865, an assessment of thirty-five cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 4th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 18th day of March, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WILLIAM VALK, Secretary.

Office, No. 36 Exchange Building, N. W. corner of Montgomery and Washington streets, San Francisco. feb4-5-4

Louisiana Silver Mining Company, Reese River Mining District, Lander County, Nevada.

Notice is hereby given that there will be a meeting of the Stockholders of the above Company, at the office of the Secretary, on the 18th day of February, 1865, at one o'clock P. M., for the purpose of electing Trustees, and for such other business as may come before the meeting.

J. E. PURDY, Secretary.

Office, Room No. 7, N. W. corner Front and Clay streets, San Francisco. 3

Morning Star Gold and Silver Mining Company, Echo District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of December, 1864, an assessment of one dollar and twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to J. W. Shanklin, Secretary and Treasurer, at the office of the Company, No. 625 Merchant street, U. S. Land Office Building, San Francisco.

This assessment is made subject to such credit for the stockholders as may have been allowed them on any payments of assessments, or expenses of incorporation, and the filing of the necessary vouchers on the same.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 1st day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. W. SHANKLIN, Secretary.

Office, No. 625 Merchant street, San Francisco. 3-4

New Year Diggings Gold and Silver Quartz Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 3d day of February, 1865, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, which assessment has been levied to liquidate the debt of the company.

Any stock upon which said assesment shall remain unpaid on Saturday, the 11th day of March, 1865, will be advertised as delinquent, and unless payment shall be made before will be sold on Saturday, the 25th day of March, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

AUG. KUNAST, Secretary.

Office, No. 540 Washington street, San Francisco. feb4-5-4

Office, Nos. 8 & 10 Government House, corner Washington and Sansome Streets, San Francisco, Cal. ja21-2-4

Scientific and Mining Journal.—This is as valuable a publication as is produced on the Pacific Coast, and one which interests all parties. It contains much that is instructive and entertaining, and seems to have the right men at the head of its affairs.—*Spirit of the Times.*

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

18-v9 SAN FRANCISCO.

THE MINING AND SCIENTIFIC PRESS.—We call the attention of our readers to an article from this valuable journal, explaining some of the reasons why it should be supported. We have no hesitation in saying it is one of the most deserving publications on the coast, in fact, the only legitimate mining journal in California. Every practical pick and shovel miner, as well as every man who may be anywise interested in mining, should have the *Press* for his own information, aside from its scientific value. Its editors and contributors are men of practical experience and qualified to speak that which they know.—*Grass Valley Union.*

THE "Mining and Scientific Press" is an excellent journal, and ought to be subscribed for by every miner and artisan on the Pacific coast.—*Nevada Daily Gazette.*

Illegal Advertising!

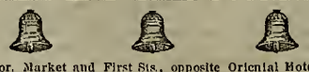
We notice many Secretaries are having their notices of delinquent sales published *weekly* in a *daily* paper. As this is a plain violation of the new law we feel it our duty to warn such parties of this error, and herewith append that section of the "Act Concerning Assessments upon the Stock of Corporations," which governs the publication of delinquent notices.

Section 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows: When published in a daily paper, the same shall be published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to the day of sale, the first publication in the weekly being at least fourteen days prior to the day of sale.

By the above extract it will be clearly seen that no delinquent stock can be legally sold by advertising in a daily paper, unless the notice is inserted *daily*.

A VALUABLE NEWSPAPER.—The "Mining and Scientific Press," published by Dewey & Co., in San Francisco, is a useful and instructive journal for the miner and mechanic; offering a vast fund of information respecting the working of metallic ores, the improvements in mining and other machinery, etc., etc. The PRESS deserves a liberal support from miners and artizans. Terms—$5 per annum, or $3 for six months.—*Placer Herald.*

REGISTAR YOUR LETTERS.—In remitting cash for subscriptions to the MINING AND SCIENTIFIC PRESS, our patrons will please register their letters, and we will then be responsible for their reception. Parties remitting without registering their letters will do so at their own risk.



[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—EDS. PRESS.

MINING PRESS.—The San Francisco *Mining Press* has entered upon its tenth volume, and bears evidence of increasing prosperity. Dewey & Co. have, by untiring industry, made the *Press* one of the leading papers of the State, and as a mining journal it has no superior in the country. Those interested in the mines on this coast can make no better investment of five dollars than by subscribing to this excellent journal.—*Alpine (Markleeville) Chronicle.*

TO MINE OWNERS.

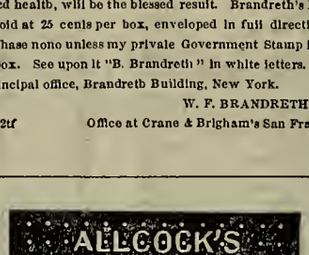
REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly tested, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address **J. MOSHEIMER,**



Office, Nos. 14 & 15 Mead's Building, Corner of Pine and Montgomery Streets, San Francisco. 9v23tfq

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prosirated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Spain, some three centuries ago, on account of her commerce, was the mistress of the seas; but want of attention to business education soon ruined her. Aspiring youths of America, learn a lesson from her, and take a course of instruction at the Pacific National Business College, conducted on the London Corn Exchange principles.

Information Wanted.—A letter mailed at Nevada City, Cal., about January 23, 1865, signed by Jas. R. English, and addressed to this office, has failed to reach us, and we hereby offer a suitable reward for any information which may be given us of its whereabouts.

Sv10 DEWEY & CO.

THE FIRST PETROLEUM WELL.

The First Oil Man Still Poor.—It may be interesting to those of our citizens who have been so fortunate in oil speculations, to know that the first man who sunk a well lives near the spot and is still poor. Col. Drake sunk a well less than 100 feet in 1859, and was the first man to strike oil. This was on Watson's Flats, below Petersville. He reaped no advantages from his discovery, and is still living, on the creek, as poor as when he bored that well, while others have made millions by pursuing the path in which he led. It is the fate of discoverers and inventors to die poor. —*Cor. of N. Y. Times.*

It is due to the truth of history to correct the above correspondent of the New York *Times*. The first oil well was bored by J. Cummings Cherry, now of this city, in the vicinity of what is now known as Cherry Run, Penn. It was bored in 1848, more than ten years previous to the date at which Col. Drake sunk his well. Moreover, Mr. Cherry has escaped the fate of pauperism attendant on most discoverers and inventors, and is now taxed for $80,000 in Pittsburg, Penn.

ORIGIN OF THE OIL BUSINESS.

It may be interesting, at this time, to give a brief notice of the origin of the oil business in this country. Mr. Cherry, the gentleman alluded to above, was engaged in 1838, by a company of adventurers to make some geological investigations after coal and iron in the vicinity of what is now known as Cherry Run, mentioned above. During these investigations his attention was first called to the existence of oil floating upon the surface of the waters of that region, and he also noticed the marked similarity between it and the oil known as petroleum, which had been brought, in small quantities, from Asia to England, and a like oil which had also been obtained, by experimental analyses, from English coals. Mr. C. was also personally acquainted with Mr. Young, whose experiments commenced about this time for ascertaining the nature of these oils. His attention, however, being pre-occupied, he soon dropped the subject.

Subsequently, in 1848, he again returned to the same field, and for the same purpose. It was on this occasion that he bored the well alluded to above. The well was put down for scientific purposes, to examine the character of the strata, more particularly with reference to the prospects of finding coal. At the depth of 200 feet the auger struck a reservoir of oil, which flowed from the well in large quantities, much to the annoyance of the landholders in the vicinity, who complained of it as a nuisance. Mr. Cherry was satisfied in his own mind, from experiments he had made, that an illuminating oil of a very superior quality could be obtained from it, and he was very urgent that the company in whose behalf he was prosecuting his investigations should take hold of the matter. They declined, believing that coal and iron were the only true sources of wealth in that direction, and the project was again abandoned. Soon after Mr. Cherry came to this State to secure the means to return and carry out his ideas of producing an illuminating oil from coal and crude petroleum. Having accomplished this purpose, he returned in 1854, visited the various coal districts in the United States; went to England, had further and protracted interviews with his former friend and co-investigator Mr. Young, who had then associated with himself Mr. Mansfield. Being satisfied of the value of their discoveries, it was agreed that if Mr. Cherry would leave the English field to Messrs. Young & Mansfield he might have that of the United States to himself. Mr. C. accordingly again crossed the Atlantic, obtained three several patents, securing to himself the benefits of his investigations, and proceeded at once to erect extensive works at Darlington, forty miles from Pittsburg, Penn. He carried on these works successfully about one year, when they were destroyed by fire. They were capable of producing about 700 gallons of refined oil per day, and cost $82,000. These were the first extensive works ever put up on the continent. After losing his works, Mr. C. devoted about two years to making further geological examinations for petroleum and coal, and then came again to this State, where he is now operating in the same line. He will soon visit the East again, to look after some infringers on his patent rights, and obtain the requisite machinery for erecting in this State, a refinery for producing kerosene from the crude petroleum, which he fully believes will soon be found here in inexhaustable quantities.

FROM ARIZONA.

We have had the pleasure of a call from R. C. McCormick, Esq., Secretary of the Territory of Arizona, who is now in this city, on his way to the East, on official business. Mr. McCormick was formerly Chief Clerk of the Department of Agriculture at Washington, and appears to be enthusiastically in earnest in his efforts to do what he can, by his official position, and by individual energy, towards opening up and developing the rich and interesting Territory with which he is officially connected. The Governor of the Territory and Mr. Lehi, one of the most active members of the Territorial Legislature, are also in the city.

We understand that through the efforts of these gentlemen important steps have been initiated toward the development of the Territory. Gen. McDowell has promised them all the military protection which they need. Mr. J. S. Poston, Esq., took with him on the Brother Jonathan, which sailed on Thursday last, the first mail for Arizona *via.* Los Angeles. This mail goes forward under the recent Act of Congress, authorizing the establishment of mail communication between California and Arizona, and is a most important step in more intimately connecting that rich mineral region with the great commercial metropolis of the Pacific.

We had the pleasure yesterday of examining, at the Occidental, a large and fine collection of mineral specimens, collected by Mr. McCormick, from the various mines in Arizona. These mines are as yet quite undeveloped—nearly all the specimens being taken from the surface, or very near it. Some of the richest gold specimens showed, from the unmistakable action of the weather, that they were taken from outcroppings. These specimens embrace most of the varieties of lead, copper, silver and gold, and present most indubitable evidences of the abundant mineral wealth of that region. We are assured that the country where these mines are located abounds in wood, grass and water, quite sufficient for machine purposes and for irrigation. There is a fine saw mill in operation in Prescott, the capital of the Territory, which is located near the intersection of the 112 degree of longitude with the 34th parallel of latitude. The Indian troubles, which have heretofore rendered the occupation of this Territory of little value, for either mineral or agricultural purposes, will hereafter be effectually removed, and the establishment of mail facilities will bring it in closer contact with San Francisco and the rest of the world. We predict an early and brilliant future for Arizona.

New Quartz Crusher.—Messrs. John Nuttall and J. W. Southwick, of this city, have filed a caveat through the Mining and Scientific Press Patent Agency, for a new quartz crusher, which may be described, substantially, as follows: A heavy cast iron block is constructed and suitably placed upon supports, through the center of which a V-shaped perpendicular cavity is left with a narrow opening at the bottom. In this cavity an oscillating die is placed, its lower extremity being held in place by a shaft passing through its center. The top of the die is caused to vibrate back and forth, by an eccentric. The quartz is fed into the machine, on either side of the die, and becomes gradually reduced by the oscillating motion thereof, as the rock descends through the lower opening, out of which it is finally forced in the usual grade of fineness to which rock is reduced by the ordinary use of stamps. Simplicity, cheapness and efficiency are claimed for this machine by the inventors.

Montgomery Rock.—Among the promising claims in Montgomery district, Mono county, are the Ontario, Dunton and Great Republic. A quantity of rock from these claims was taken to New York last fall, by J. B. Levet, Esq. This rock was worked in that city by a crusher recently invented by P. G. Gardiner, and is said to have yielded at the rate of $1,700 to $2,000 per ton. We understand that a conditional sale has been made of a majority interest in these claims to an Eastern company, which will probably put up machinery upon them forthwith.

Rare Specimen.—A very rare cabinet specimen was recently taken from the Confidence Mine, at Gold Hill, Nevada. This specimen consisted of a crystal about one and one-half inches in length, near the center of which was imbedded a bunch of sulphurets.

Measuring the Weather.—A Frenchman, named Morin, has invented a new barometrograph, consisting of three parts—a clock, barometer, and an electrical apparatus. The clock, while it marks time, also causes a cylinder to turn round once in twenty-four hours, its surface receiving the marks of a style connected with both the barometer and electrical apparatus, and balanced by the weight of a rack attached to a string passing over a pulley. Every quarter of an hour this rack is raised by the machinery, the style descends to the surface of the mercury, and thereby establishes a complete electrical circuit, which immediately magnetizes a horse-shoe magnet, and causes the style to make a mark on the cylinder.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Metallurgy of Copper in California.

[By Paul D'Heirry, M. D., Mining Engineer, Professor of Chemistry and Metallurgy, Superintendent of the Copper Mining and Smelting Company, Queen of Bronze, Oregon.]

NUMBER FIVE.

PROCESS OF REDUCTION.

The treatment of pyritous copper ores is based on the following principles and properties:

1st. The greater affinity of oxygen for iron than for copper.

2d. The greater affinity of sulphur for copper than for iron.

3d. The greater affinity of protoxyd of iron for silica.

4th. The little affinity of silica for metallic copper and its sulphuret.

5th. The little affinity of metallic iron and copper for one another.

6th. The reductive power of carbonic oxyd.

The five following operations serve to utilize these different properties of bodies in order to obtain metallic copper:

1st. Calcination in heaps in the open air.

2d. Smelting for regulus or matt in cupolas.

3d. Calcination of regulus in shut kilns.

4th. Smelting of regulus for black copper in cupolas.

5th. Purifying the black copper in small German hearths.

The first operation, the calcination, has for its object the decomposition of the pyrites of iron, the expulsion of a part of the sulphur, antimony and arsenic, and the return of the iron to the condition of oxyd.

The second operation, the smelting for regulus, tends to unite the protoxyd of iron with the silicia, in order to form a silicate, and to scorify, in the same manner, the earths which the ores may contain, whilst the copper, in the condition of sulphuret, escapes to the silica, and falls to the bottom of the crucible by its greater specific gravity.

The third operation, the calcination in kilns, serves to decompose the sulphuret of copper, which is changed into oxyd, mixed with a little sulphate, and the injurious matters are entirely expelled.

The fourth operation, the smelting to obtain black copper, scorifies the greater part of the oxyd of iron that remains, expels almost all the sulphur, and leaves the copper to fall to the bottom of the crucible in the condition of a metal and protoxyd, sullied, still, by a small quantity of iron, and of sulphur, which the fifth operation, the purifying, carries off completely, leaving the copper in a pure state. This copper is known in commerce under the name of rosette copper.

We will examine hereafter the numerous reactions which are accomplished in these different operations.

FIRST OPERATION—CALCINATION IN HEAPS.

The heaps are thrown up on an area of earth and sand well pounded. The heaps should be sheltered on the side of the prevailing winds. The quantity of ore which is put into the heap varies from fifty to two hundred tons. One hundred tons appears to be the most advantageous quantity. The heaps have the form of truncated rectangular pyramids. The small side of the base is generally fifteen feet. The large size extends according to the quantity of ore used. The hight varies from five to six feet. A heap burns two months, more or less, according to the quantity of ore, and the atmospheric conditions.

We place at first, upon the area, a foundation bed of sticks of wood, arranged parallel to the small side of the rectangle, and upon it a second bed of sticks of wood, crossing the first at right angles. The quantity of wood to use depends on the nature of the ores and its condition to humidity. There ought to be a sufficient quantity of it to kindle the ore, which ought, then, to burn by itself. There must be care to contrive horizontal canals between the sticks.

Upon the wood is piled the largest pieces of ore, forming a bed of a foot and a half in thickness. The heap is then made with pieces of ore of every size, reserving the smallest for the upper part. In the axis of the heap there are contrived three or four perpendicular chimneys, formed of large pieces of ore, and communicating with the canals reserved in the layer of wood.

Upon all the faces of the heap is placed a covering of small ore of eighteen inches in thickness, well piled, and whose base rests on the first bed of large pieces. It is seen that it is necessary to leave a space projecting, around this first bed, to support the covering. It is to crush ore for this covering that a crushing machine is necessary. The wood is kindled through the chimneys and canals. As soon as the two beds of wood are lighted, the chimneys are stopped up with ore. It is necessary to obtain a gentle and equal combustion, in order that the sinking of the heap be made without shaking. We stop up, with care, the fissures, which may be produced in the covering during the sinking.

We then leave the calcination to go on; the fire, in the meantime, rising by degrees, and as it were by the horizontal beds, up to the upper parts. But in spite of all precautions, the combustion is rarely regular, on account of atmospheric conditions.

As soon as the ores are cold, they are put into the smelting establishment. The largest pieces, in which the oxydation has been too imperfect, are put aside, to repass a new calcination.

REACTIONS OF CALCINATION.

The air coming into the lower beds by the openings, which the large pieces of the base leave between them, feeds the combustion of the sulphur in the exterior of the pieces, whilst, from the interior of the same pieces, sulphur is distilled; sulphurous acid is produced, and in consequence, of this production, the air introduced is soon deprived of its oxygen; it is this which causes the fire to maintain itself on a horizontal thickness very slight.

The nitrogen and sulphurous acid, rising in the heap, heat successively the beds which they traverse. At the same time that the fire mounts, the pieces which form the base of the heap, and where the formation of the sulphurous acid is slackened, undergo the oxydizing action of the air which traverse them, and there is formed metallic oxyds and sulphates.

The oxydized surface forms around each piece a crust which does not allow the air to penetrate to the interior, but in decreasing proportions, in consequence of which, the combustion of sulphur is stopped, and the piece is cooled. The center of pieces which are a little large, cannot, therefore, undergo any other change than an incomplete distillation of sulphur. It is perceived that the use of too big pieces would have a large refuse, which it would be necessary to subject to a second calcination. However, we cannot use too small pieces, for it is necessary that the air should circulate freely in the whole heap. The largeness depends on the density of the ore.

If the ore is poor and with an earthy vein-stone, it will be requisite to use more beds of fuel; for, in such ores, the sulphur would not be sufficiently abundant to keep up the combustion. If, on the contrary, the ore contains a large proportion of iron pyrites, it will be requisite to moderate the draught, in order to avoid the fusion, which cause a loss, more or less considerable.

As to the arsenic and antimony, this is what happens:

1st. As soon as the sulphur commences to distill, they escape under the form of volatile sulphurets.

2d. At the period of oxydation, arsenerous acid and oxyd of antimony are formed, of which a notable proportion is volatilized.

3d. Another portion of this acid and this oxyd being formed in contact with other metallic oxyds, makes with them arseniates and antimoniates which remain in the ore. We will not speak either of lead, or zinc, or of lime, which are without importance now.

If theoretically, we consider the result of the calcination, we find:

1st. Silica and earthy matters.

2d. Sulphuret of copper.

3d. Peroxyd of iron.

4th. Antimony and arsenic almost expelled.

But, in practice, it is not thus, and the calcination, in spite of all the pains which can be given to it, remains always imperfect. The more the practical result will approach the theoretical one above mentioned, the more the operation will be advantageous, and will make more easy and more profitable the other operations which we are about to describe.

The calcination has produced little change in the weight of the ore; the expelled sulphur being replaced by oxygen.

When the floor of the area, where the ore is calcined, is much impregnated with copper, it is taken away, and passed to the smelting with the ores.

[To be Continued.]

Daniel Webster and Edward Everett.—There were just three days difference in the age reached by these eminent statesmen and friends at the time of their respective deaths. The former was seventy years, nine months and six days, the latter seventy years, nine months and three days old.

Written for the Mining and Scientific Press.

Petroleum—Its Constituents, and Hints with Regard to its Distillation.

It is now a well established fact that there are numerous and extensive petroleum and asphaltum fields covering the linear extent of our coast boundary; though they are of so recent discovery that our knowledge of their geological position, extent, richness, and character is limited. Recent developments through scientific investigation, have, however, given us a data from which to work, and it is now in our power to arrive at facts connected with the petroleum formation with a degree of certainty necessary to be obtained, and which facts are of the greatest value as connected with the developments of the petroleum interests of the Pacific coast.

It is, however, painfully evident that we have failed to bring into action one grand element, without which our discovery is neither one of value nor utility. The field of research is a new one, even to many of our ablest geologists and chemists, and as a consequence they find many obstacles in the path of success, and have made failures in attempts at mastering the difficulties which surmount the, to many, petroleum mystery. These failures should not prove disheartening, but, on the contrary, should learn us the plain, but patent truth, that in our own egotism we have forgotten that we know nothing of the business in which we would wish to embark; that we are ignorant of even its simplest rudiments, and, therefore, cannot expect aught but failure where often the most complex science is at loss. The one element required is information combined with a thorough and practical knowledge of the geological formations which accompany the pretoleum deposits, the chemical constituents which enter into the structure of the oil, and the mode of treatment to which they should be subjected in the refining process. Such knowledge we may not expect to acquire in a day, for it is a palpable truth that the direct experience, extending over years, which our Eastern friends have enjoyed, and the heavy combination of scientific talent which has been brought to bear on the petroleum mystery, have given us little beyond speculation and theory to guide us in our investigations; and with the usual progressive spirit of Californians called into action, and with the aid of scientific truths and scientific men—those who have ability and experience to recommend them—we will have fewer humiliating failures, or, more properly, blunders, to explain away.

As many erroneous views are indulged in by the public, and also by some oil refiners, our most urgent need, at the present, is for reliable information regarding the process by which our native petroleum may be refined. To enter into such full and extended exposition of the refining process as would be required to give a knowledge of its complex mysteries would call for space more extended than is allotted to an article for the press, but we may be allowed in the present article, to present a few practical hints for the consideration of experimentalists.

It should be understood that mineral tar or crude petroleum is not a substance of invariably similar constitution, but that though the constituents are generally the same, their proportions vary in different samples, and the causes of the variations therein are not yet generally understood.

In the distillation of mineral tar or crude petroleum, the products which are generally recognized as distinct, and are separated from each other, are ammonical water, oil heavier than water, which I term dead oil, and oil lighter than water. The light oil (of which the first and the last portions are sometimes received separately, in which case I call only the first portion naptha or hydro-carbon oil,) comes over at first, accompanied, more or less, with water, and afterwards the heavy or dead oil which is separated from the light oil, by changing the receiver when the distillation begins to sink in water. Some samples of the mineral tar also yield a large quantity of napthaline and oil, which is solid at ordinary temperature.

In distilling mineral tar or crude petroleum, which contains much napthaline, the last portion of the light oil and the first portion of the heavy oil will deposit solid matter in cooling. In some crude petroleum the napthaline, together with paranapthaline, another solid oil, exists in such quantity that a large proportion of the heavy oil solidifies in cooling. Other samples of crude petroleum contain so little napthaline that no solid matter is deposited, except by the last portions of the oil, which are distilled over at the highest temperature to which the retorts are generally exposed. The distillation is usually stopped when the oil ceases to run freely fluid. The light oil, or the naptha, or hydro-carbon oil, alone, is usually rectified from a portion of heavy oil, which it contains by again being distilled, and is more or less purified by treatment with acid, which is usually concentrated sulphuric acid, if the oil be required colorless, and then forms the rectified mineral naptha, or hydro-carbon oil of commerce; the less valuable part of the light oil, when separated, and the heavy or dead oil, is not usually rectified, but is applied to coarse purposes, in which a pure article is not required.

The rectified hydro-carbon oil of commerce generally commences to boil at 65 degrees, (centigrade thermometrical scale,) and a considerable portion of it distills even before the temperature in the retort, reaches 100 degrees, and the temperature gradually rises as the distillation continues, and the heavier grades of oil distill over, until it reaches 160 to 180 degrees, when the retort generally becomes dry. It will be seen that the processes through which the crude material must pass before the hydro-carbon oil is separated from the heavier grades of oil are many and minute, and the slightest error or inattention will destroy the material, and it is eminently necessary that the character and constituents of the sample under treatment should be fully understood by the chemist, as the changes which occur through chemical manipulation are of the most delicate character, and require to be closely observed. It will also be seen how it is possible that the rectified hydro-carbon oil, which is so extremely volatile, may be evaporated, or distilled over and lost without the theorist and experimentalist being even aware of the fact, and the heavier or lubricating grades of oil being alone left, as a result; and I venture to say that in this, is the grand secret of the failure of many to produce a burning oil from our California mineral tar and crude petroleum. The burning qualities of the hydro-carbon oil may also be destroyed by neglecting to separate it carefully from the heavier grades, and in its treatment by acids and other chemicals, when the chemicals are not used in proportioned quantities, or in the successive distillations which are required.

Other dangers are yet to be apprehended. It is known to chemists that the crude oils of mineral tar, or native petroleum, contain a quantity of oily matters, some of which are acids and have received names such as carbolic and rosolic acids, and others, and some alkaline, which have been called aualine, picoline, pyrol, &c.; and besides these an oil, which by exposure to the air, becomes converted into a brown resinous matter. The object of the processes of the purification of the oils has been to disengage and remove these substances, and this is made more difficult, and requires extended knowledge, from the fact that the nature and properties of the neutral oils, some of which constitute the rectified naptha, or hydro-carbon oil, have not been hitherto known, except that they are hydro-carbons, that is, composed of hydrogen and carbon alone, and that the naptha has been supposed to be a mixture of several such bodies. Then again the hydro-carbon oil may not be thoroughly purified of these substances, and, in consequence, it cannot contain the qualities of refined naptha.

The query has arisen, "can an oil possessing burning qualities, be produced from asphaltum deposits?" I do not hesitate in answering in the affirmative, though I am convinced, from experiments made, that asphaltum does not contain as large quantities of the lighter grades of oil or hydro-carbon oil, as do the mineral tar and crude petroleum deposits, found separate from and not connected with the asphaltum beds. In some instances the asphaltum on the surface, and for a distance beneath the surface, contain only traces of the naptha, but its non-existence is readily explained by its excessive volatility, and when a depth below evaporating influences is obtained it will be found to exist in considerable quantities.

The complex apparatus required and the minute treatment to which the oil is subjected, in a practical test, before even an opinion can be hazarded as to the quantity and yield of the crude material, is a serious drawback to investigation, and the need of a simple and not very expensive method of making a practical test of mineral tar and petroleum, is urgently felt by the experimentalist. I have found in my investigations that it may always be ascertained by a single experiment with a small retort and thermometer, whether any sample of mineral tar or petroleum contains sufficient of spirituous substance to render it worth distilling, it being observed whether a large or small portion distilled over at a temperature below 100 degrees. This method will also apply to the obtaining of volatile spirituous substances from other tarry and bituminous and hydro-carbonaceous matters such as coal tar, wood tar, oils distilled from bituminous schist, from caoutchouc, and other such matters which are of nearly similar volatility with mineral tar and petroleum, but not necessarily corresponding in other properties.

J. Cummings Cherry.

"Delta" Replies to "C. A."

Messrs. Editors:—"C. A." in his last communication is greatly excreised at the flattering notices of his poor efforts on the "Calvert Process." In retaliation he accuses "Delta" of muddled explanations and illogical inferences—his own dullness incapacitating him to see the points, slightly sketched out by the above writer. Finding no other reasonable points of attack, he stoops to the correction of typographical errors occurring in his adversary's article, evincing thereby no inconsiderable amount of ill will and illiberality—the very traits he finds exceptionable in Mr. Rowlandson's notice of Calvert's Process. Mr. Rowlandson objecting to answer him as an anonymous writer, is modestly informed by "C. A." that he desires no notoriety. But let me ask any unbiased man whether "C. A." in his sneering answer, abounding in senseless personalities, writes like one whose only object is the truth?

True to his sophistic instinct, he winds up his elaborate remarks by asking pedantic questions. He commences and asks, "Who made the discovery that chlorine gas could be generated *from* dilute sulphuric acid?"

As my manuscript read: "Chlorine gas generated *by* dilute sulphuric acid," the "typo" could perhaps answer the question better than I can. I have also to inform "C. A." that he missed an excellent opportunity to make capital out of a serious typographical error, and the omission of several prepositions in my last article. Pity he overlooked this better base of attack. Your illiberality to your adversary, "C. A.," is too apparent not to miss its object.

The second question: "How strong is strong chlorine gas, and how may it be distinguished from gas that is not strong?" is a very smart question for one to ask who considers himself so great a light as a chemist and metallurgist.

Did you ever hear of strong acid, "C. A.?" Strong acid, in distinction to diluted acid, is such gas dissolved in the least quantity of water, analagous to which strong chlorine gas is such gas mixed with the least quantity of atmospheric air or other gases. When the worker of Plattner's chloration process, in raising the lid of his vat, observes that the gas is intensely green, he considers the gas strong, and he is satisfied with the roasting, as well as with the chloration of his gold; if the gas is very light green—*i. e.* mixed with considerable air, the gas is weak, and the operation is imperfect. If this "explanation" is too "muddled," I will endeavor to be plainer in my next.

He next asks: "Was it not chloride of *silver*, instead of chloride of gold which, by forming an insoluble crust on the particles of gold obstructed the process of chlorination?" [Chloration, according to the best authority.]

My reason against this assumption is, that if such was the case, the gold could not be extracted in re-working the ore—as the crust of chloride of silver remained—an operation of no difficulty, and sometimes performed after an unsuccessful chloration of the gold in sulphurets badly roasted. If, however, the gold is coarse—a very rare occurrence in sulphurets previously treated by amalgamation—the chloride of silver, apparently accumulating, actually obstructs the chloration of the gold.

But, let me proceed, and refer to "C. A.'s" logical ruling.

He says: "'Delta' further says sulphide of gold is formed;" to which conclusion he is led by the astonishing fact that he "failed to detect metallic gold" in a substance from which he had already extracted the greater, and doubtless most exposed portion of that metal—a logical conclusion, truly!

If "C. A." had studied and practiced the chloration process, he would know that if tailings contain as much as $70 per ton an occurrence after an imperfect chloration, on account of bad roasting, it can easily be detected, when in the metallic state, by grinding up a small quantity in a porcelain mortar. Persons accustomed to this mode of testing become so expert at it, that by thus grinding up half an ounce of roasted sulphurets, they can generally guess within $10 of the value per ton. So small an amount as five dollars per ton in sulphurets can, by this process, be readily detected. Now, if the tailings contain $70 in gold in the metallic state, as it occurs in roasted sulphurets—not to speak of metallic gold precipitated by copperas, such as would float off in washing—it is very likely that that quantity would be detected by any *practiced eye*, particularly as the chloride of silver has been removed by rubbing in the mortar. But it happens, sometimes, that not even a trace of gold can be detected in tailings assaying as high as $70 to the ton. Furthermore, as the gold cannot be in the form of a chloride after a good filtering, nor in the form of a black or brown floating powder, as metallic gold, it is but natural to infer that it is in the form of a sulphuret, precipitated by sulphureted hydrogen, the weak gas being unable to redissolve it again. The smell of sulph. hydrogen and hydrochloric acid in badly roasted ore, when under the process of chloration, is perhaps a good additional reason for its presence. Plattner, as I have already said, and Georgi, of Reichenstein, where the process is employed on old tailings, support this view.

But "C. A." informs me that the salts of peroxyds are transformed into protoxyds by sulphureted hydrogen, which leads me to infer that he means sulphate of iron could still be the precipitating agent of the chloride of gold, instead of sulphureted hydrogen.

Admitting the above reaction as a true one, though doubtful on account of the counteracting or reverse influence of chlorine, is it not plain to "C. A." that the sulphureted hydrogen has already precipitated the chloride of gold, as a sulphide, before any action of the sulphate of iron or chloride of gold can take place in the dry ore, as we use it in Plattner's process? Sulphate of iron, possibly present, has to be in solution before it can act on undissolved chloride of gold.

As I drew no parallel between Plattner's and Calvert's process in my last, I will now state that Calvert's process will undoubtedly succeed on quartz rock, though not on raw sulphurets; but being a very tedious process in which the health of the operator cannot fail to suffer, amalgamation will far outstrip it in practical utility. As far as the treatment of roasted sulphurets is concerned, Plattner's process being the simplest, and exposing no one to an affection of the lungs, will be decidedly preferable.

In conclusion, allow me to inform "C. A." that even if his experiments on the Calvert process failed, it will be very poor proof of the failure of the process, as the writer knows numbers of *theoretical chemists* who tried Plattner's process in this State, and *failed*, though "even" Delta" is able to show them," that the process *could* be successfully carried on, and supersede every other process for working sulphurets, in the State. "*Si takuisses' C. A.' philosophus, mansisses.*"

Delta.

THE PINE WOOD DISTRICT.

This new and already celebrated mining district is located about 180 miles northeasterly from Virginia City. It is said to abound in wood and water, grazing, game, etc. Many prospectors are already finding their way thither, and quite a number of prominent settlers have located themselves in the vicinity of the mines. The first important location was made by a party who immediately dispatched several of their number to New York, to interest some of the capitalists of that city in the development of their discovery. A large amount of the ore was also shipped. The mission was quite successful, and one of the number was sent back to represent the interest of the new company. This gentleman, Mr. Rose, has recently arrived at Virginia City, and active measures will be at once taken to develop the company's ledges, for they have several. A twenty-stamp quartz mill for this company is already on the way to this port, *via* Cape Horn, and a large amount of rock will soon be in readiness for crushing. Other and equally promising locations have also been made by other parties, for the development of which Eastern capital will also be invested. The ledges in this district are said to be very large, some of them measuring from twenty to twenty-five feet in width, prospecting well on the surface, and rapidly improving so far as work has progressed downward. Large anticipations are founded upon this latest discovery in Washoe, and it is predicted that the Pine Wood district will soon eclipse in value and extent any others on the Eastern slope. We trust the expectations of all concerned will be fully realized. We verily believe that the half of our unbounded mineral resources is not yet known or dreamed of.

Explanation of the Mining Term "Wheal."

Editors Press:—Your having stated that many of your readers had expressed a desire to know the meaning of the word "wheal," so frequently prefixed to Cornish mines, I will endeavor to furnish the desired information. In order, however, that the matter may be fully understood it will be well to mention that up to within a century a dialect of the great Celtic language was spoken very generally among the most remote mining districts of Cornwall, a variety of which language is still spoken on the opposite coast of France and Spain, in Brittany and the Basque Provinces: and may still be heard in the Isle of Man, Wales, Ireland and the Highlands of Scotland. The original word is "Huel," not "Wheal," and was so written and pronounced until about thirty or forty years ago, when the corrupt spelling wheal began to make its appearance in mining papers, and has since been generally adopted. The interpretation of the word wheal is mine; thus when "huel" or "wheal" Alfred or Ann, etc., is expressed it means mine Alfred, Ann, etc. One of the oldest mines in Europe, Huelgoeth near Poullaouen, in Brittany, France, continues to be so called, as being the mine worked originally by the Goths or Vikings—in other words the Norman invaders of France. I believe this is the only mine remaining where the original Celtic word is now used. Poullaouen is derived from what is now spelled in Welsh "peol" and from which the English word "pool" originates.

Huelgoeth is remarkable for other matters besides its very ancient workings and names; for at this mine considerable quantities of chlorides of lead and silver have been and continue to be found. It is also remarkable for very elaborate hydraulic and dressing machinery, and also as being the first locality in which plomb-gomme or hydrated aluminate of lead was found, and of the zeolitic mineral "laumonite," which was discovered here by Gillet Laumont in 1785.

As a parting word respecting Dr. Calvert's supposed improvements in extracting gold, by the humid way, especially as your correspondent "C. A." has, in your last number, issued a sort of challenge on the subject, rather illogically based on asserted misrepresentation on my part, I wish to observe that some parties have misunderstood me as being opposed to the humid process of extraction. Such is not the case; I favor it, and conceive that there are many cases where such a mode may be adopted most profitably. All I wished to remark was that Dr. Calvert had only alluded to a process years ago recommended by Plattner, and that the *modus operandi* described in Dr. C's paper was a rude and unskillful one. I deny having made any misrepresentation. If any such has occurred it can only be attributed to errors and vagueness of expression arising from the article which appeared in the *Mining & Smelting Magazine*, having been *cut down* for publication in a very unskillful manner, a fault for which I am not answerable.

When more at leisure, I will endeavor to point out the various modes which may be adopted for extracting gold by the wet way. C. A. has somewhat hastily and illogically applied a particular meaning to a vaguely expressed sentence, which by the strict rules held to apply to such cases ought to have been extremely explicit.

Thomas Rowlandson.

How to Wash a Thread-Lace Collar.—Take an empty bottle, cork it, push it into the leg of a stocking, and tie a string round the stocking at each end of the bottle, so that it will fit the bottle tightly. Now baste your collar on to the stocking; the more carefully basted the edges are, the greater will be your success. Carry the collar round and round the bottle, allowing it to retain its shape easily. Soap well and let it soak over night; rinse with hot water in the morning, and allow it to *dry on the bottle;* when taken off it will look as good as new, and need no ironing.

Its Meaning.—In an address before a Teacher's Institute in Santa Cruz, by one of the teachers, he announced that the name Christopher Columbus signifies "Christ-bearing Carrier Pigeon."

(Written for the Mining and Scientific Press.)

Letter from Folsom.

Messrs. Editors:—To give you some idea of the present and future prospects of this place, it was necessary for me to make a few personal investigations, and the following is the result of my observations thus far: In the immediate vicinity of Folsom, but little of importance is doing in mining. The noticeable features in the improvements are in quite a number of new brick houses, extending and putting in running order the Latrobe railroad track, and the immediate construction of a rail track leading to the granite quarries near this place. Money matters are still very tight, although there are quite a number of monied men here. The scarcity of change among the mechanics and traders is attributable to the Sacramento Valley R. R. Co. not paying their help for some considerable time back.

There are mines within a few miles of this place that are paying handsomely. In my visit to the Willow Spring region, I saw quite a number of good paying claims, now all being worked; the claims that are being worked in the vicinity of Mormon Island, etc, are all doing well. There are two gold dust buyers here, and yesterday being Sunday, I had a chance to see the hardy miners gather, in flocks, to dispose of the result of their week's toil. You must not infer from what I have just written that these were white men doing business on the Sabbath. No, they were the Mongolian stock, that curse of California, that will yet prove a source of trouble to our State.

For the benefit of the prospectors, Messrs. Palmer & Day, Assayers, and Wells, Fargo & Co.'s Agents here, have erected a small quartz mill in connection with their fine assaying department, so that the miner, when he finds anything that he thinks worth testing, can have it put through all the necessary operations near home, without spending more than it is worth in taking it to San Francisco. The want of something of this kind has been a great drawback to developing the vast mineral resources of this and other sections of our State, and cases have come under my observation where the discoverers of rich deposits, entirely ignorant of what they had, have entrusted their discovery to some designing speculators who have feathered their nests at the expense of the poor prospector. This should not be so, and a new system is now being inaugurated in the mining world, and things will soon be better. Yesterday I was shown some very fine specimens of quartz rock just brought in by a Reese River miner who has been prospecting in this neighborhood. The rock indicates silver, and I think, judging from outside appearance, is strongly impregnated with that metal.

Traveler.

Folsom, February 13, 1865.

New Mill for Crushing Gravel.—Messrs. Neece & West, of Brown's Hill, near Walloopa, are about to put up a ten stamp mill for crushing the gravel from their diggings. Four mills are already running upon gravel in this vicinity. Miners thereabouts find a large profit in running their gravel through a mill, over that of ordinary sluicing. The gravel found in these diggings is a hard cement, which cannot be dissolved so as to be separated by water without being first crushed. But another important advantage derived from this mode of washing gravel is the fact that but about one-tenth part of the water is required; which greatly facilitates the saving of fine gold, a large amount of which, experience has demonstrated, is lost by the necessity of using the quantity of water requisite where the gravel and gold must be separated, by washing alone, from the coarse rocks and boulders.

Important to Inventors.—In the patent case of Marey *vs.* Protter, an appealed case before the U. S. Supreme Court, the judge, in his decision says: "The policy of the patent laws favors diligence and condemns neglect. It is the duty of an inventor, without delay, to patent his perfected invention. He has no right to use it himself, or permit others to use it, for any length of time, and then expect a monopoly from the public."

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, FEB. 25, 1865.

The money market continues to grow easier with a decided tendency to lower rates of interest. Capital is readily accessible to borrowers in good credit at 1¼ per cent. per month, and some important negotiations have been made this week upon still more favorable terms. The difficulty experienced in loaning funds to be employed for regular business purposes, and upon Real Estate and other Collateral usually prefered by capitalists, has diverted some means hitherto idle into stock channels and the share market has been somewhat stimulated thereby.

Receipts of Treasure from the interior since Saturday last have been rather lighter than usual and amounted to about $750,000. Gold bars were in good demand on steamer day, and sold at 880@890. Silver commands 1@2½ per cent. premium for selected grades and ranges as low as 2 per cent discount for less desirable rates.

No important change has taken place in the share market. Certain leading stocks have been well maintained at enhanced rates, while others were freely offered and declined materially.

Speculative mining stocks continue neglected and there is evidently less disposition than ever to invest in such "fancies" without some tangible evidence of intrinsic value, however small it may be. Most City shares seem to be in the hands of parties who desire to hold them as an investment, and many of these incorporations now promise so well that no decline from the present current market value is feared and prices are well sustained.

San Francisco Gas is held at $85; California Steam Navigation at 81 per cent. and Sacramento Gas at 65. State Telegraph is inquired for at $35. Spring Valley Water. (now 60,000 shares of $100 each.) is strong, at the recent advance, and can be sold at $51 per share. Small sales of San Francisco 6 per cent. Bonds of 1858 were made at 61. San Francisco City Water Works Company have declared a dividend of ½ per cent. out of the earnings for December.

Legal Tender Notes have been very active, and some $190,000 were dealt in at from 49 to 51¾; closing at 49, seller 30. The Sub-Treasury in this city is in receipt of $3,000,000 Compound 6 per cent. interest notes, which are likely to be disbursed and on the market at an early day. Latest telegraphic advices from the East quote Gold in New York at 213@215, on the 24th inst.

Gould & Curry was in active request early in the week, and rapidly rose from $1,680 to $1,825, under the influence of eager buyers; then declined to $1,675, and closed yesterday afternoon at $1,650, seller 30; 85 feet were sold. A portion of the mine has shown some improvement recently, and its future productiveness is thought to be more promising. The regular dividend of $75 per foot will be declared next week.

Savage has been more actively dealt in, and 39 feet changed hands, advancing from $1,590 to $1,620, receding to $1,600, and selling yesterday at $1,550@$1,575. The product of this mine continues to be fully up to the average of the past few months, and it is understood that a considerable surplus will remain in the Treasury of the Company after the payment of a dividend of $75 per foot for the current month. Receipts of Bullion since the 1st has not amounted to $150,000.

Yellow Jacket steadily improved since Monday last—advancing from $1,480 to $1,590, and closing at $1,590—within which range 90 feet were sold. Reliable advices from this claim represent its present appearance as being decidedly flattering. After paying a dividend of $75 per foot, on or about the 3d proximo, for the month of February, it is believed that a balance of some $25,000 will remain at the credit of the Company.

Belcher advanced from $1,100 to $1,180—at which latter rate small sales were made. This stock is well concentrated, and was strongly held yesterday at about $1,200. The Company have now on hand a surplus of some $85,000, and a dividend of at least $60 per foot is looked for.

Crown Point rose from $825 to $910 per foot, and is now in request at $820 bid, $950 asked. In drifting from the 230 feet level, a large body of good ore has been disclosed, which will soon add materially to the product of this mine. The Company are now out of debt.

Chollar has been unusually active, and 209 feet were sold, advancing from $815 to $915, receding to $725, rallying to $780, dropping to $730, rising to $750, seller 30, and closing at $710 asked. We can learn of no unfavorable feature in the appearance of this mine, which is said to be yielding ore as abundantly as ever. The yield of bullion is, however, lighter than was anticipated, and this may lessen the probabilities of a dividend next month.

Potosi has met with no sales this week, but is rather firmly held at $800. Receipts of Bullion thus far during the month amount to $100,000, and the Company have 1000 tons of ore on hand at their mine.

Ophir advanced from $390 to $405, at which rates small sales were made, and was offered yesterday at $420. The receipts of Bullion from this mine from the 1st to 15th inst., amounted to $37,500. The Superintendent writes this week that "under the old incline in South mine, he has struck a rich body of second class ore, assaying $60 per ton, also "that the supply of third class ore in North mine continues." The New Mill, on the Carson river, reduced during the month of January, 736 tons. Inclement weather and defective working of the new machinery, caused a suspension of operations for eight days. The new machinery on the Mexican claim is all up, and the work of sinking already commenced. The vigor with which this work is being pressed by the two companies, will soon demonstrate the fact whether or not the rich veins of the Comstock are confined to their present comparative superficial workings.

We are assured that the reports on the street of a compromise between the Ophir and Burning Moscow, have no foundation in fact.

Uncle Sam has been active and 139 feet changed hands, opening at $280, rising to $295, declining to $275, rallying to $300, dropping to $280 again, and again rallying to $300, then selling at $285. The mine is said to look well and some consolidation or compromise with the Overman company will doubtless be effected. The precise nature of the negotiations now pending is only known to those holding controling interests in these two companies. Overman advanced from $225 to $250, fell to $210, rallied to $240 and closed at $240 asked.

Empire Mill & Mining Company is held at about $475 per share. Hale & Norcross was sold at $235, but is inquired for at $250. The incline outside the ledge is now down 110 feet from the 535 feet level.

Imperial is in better favor, advancing from $136 to $150 per share, and closing yesterday afternoon at $145 asked. Different portions of the Alta mine have materially improved recently and after the payment of a dividend of $7½ per share for this month, the company will have a surplus of some $20,000 on hand.

Bullion rose from $105 to $125, and declined yesterday to $110, at which rates 175 feet were sold.

Burning Moscow has been rather more quiet this week and 1,020 shares were sold within a range of $58 and $70, closing at about $68.

North American was sold at $27@$29; Golden Age & Empire at $9½@$10; Nevada, (J. G.) at $35@$36, and Sierra Nevada at $17 @$19.

The aggregate sales of Stocks and Legal Tender Notes since Saturday last amounted to $688,025.

Authorized Scale of Commissions Adopted by the S. F. Stock and Exchange Board.

Miscellaneous.

Funded Debt, on par	½ per cent
Insurance Stocks, on par	½ per cent
Wharf Stocks, on par	½ per cent
Gas Stocks, on par	½ per cent
Railroad Stocks, on par	½ per cent
Steamboat Co. Stocks, on par	½ per cent
Telegraph Co. Stocks, on par	½ per cent
Water Co. Stocks, on par	½ per cent
Legal Tender Notes and Bonds, on par	½ per cent
Bills of Exchange, on net amount	½ per cent
Mint Certificates, on net amount	½ per cent
Specie, on net amount	½ per cent

Commissions on Mining Shares.

Sale at 1 dollar up to 10 dollars per foot	$0 25 per foot
Sale at 10 dollars up to 25 dollars	50 per foot
Sale at 25 dollars up to 50 dollars	1 00 per foot
Sale at 50 dollars up to 100 dollars	1 50 per foot
Sale at 100 dollars up to 200 dollars	2 50 per foot
Sale at 200 dollars up to 400 dollars	5 00 per foot
Sale at 400 dollars up to 600 dollars	6 00 per foot
Sale at 600 dollars up to 800 dollars	7 50 per foot

From $800 to $3,000 per foot, one per cent, on the amount of purchase or sale.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

J. B. E. CAVALLIER, President.

(Written for the Mining and Scientific Press.)

Water Engines for Mining Purposes.

MESSRS. EDITORS:—One of your scientific papers recently contained an observation indicating that the so-called water-column engines are almost entirely unknown in our country. As they are probably the cheapest labor-saving machines, a short notice of them might be of interest, especially to our mining community.

In construction they are almost identical with the steam engine; there is either a horizontal or vertical cylinder, in which a piston moves, the motor power of which is a water-column, a valve causing the pressure of the water to alternate between the upper and lower side of the piston. In some of the modern engines, this valve is of the slide pattern, but in most engines a piston valve is used. The motion which regulates the valve is, in those engines which work rotary machinery, similar to that of the steam engine; but where the engine has only an up and down motion, the valve has to be steered either by weights or by a small water-column engine. These arrangements make their valve motion somewhat complicated, which is not lessened by the necessity of shutting the water off gradually, as the immense weight of the water column, if brought to a stand still suddenly, would shake the engine dangerously, and might burst the pipe leading the water to the cylinder.

The water column is generally several hundred feet high, which brings a great pressure on every square inch of exposed surface, amounting, in some instances, to over 300 pounds, (the water column driving the engines in the silver-mines of Clausthal, Germany, has a hight of 750 feet,) it is therefore necessary to have the cylinder heavier than is usual in steam engines.

These engines work of necessity slow, so as not to have the mean velocity of the water in the pipe, and consequently the hydraulic hindrances, too large. Usually they make not more than four to six strokes per minute. This slow motion adapts them particularly for pumping purposes in mines, where large bodies of water are to be lifted to great hights. So far they have, with few exceptions, been used for that purpose only.

The size of the engines depends of course on the supply of water. If the quantity of water in cubic feet, to be supplied per second, be multiplied with the mean velocity of piston, in feet per second it is intended to run the engine, the product is the cross area of cylinder in square feet for a double acting engine.

The size of the water pipe is derived from the following formula: $\frac{a}{b} = \frac{c}{d} V$ — in which a = area of water pipe, b area of cylinder, c initial velocity of piston, d velocity at end of stroke. As to the labor which these engines are capable of performing, the average result of a number of experiments made on one French, two English and six German pumping engines, showed that the power represented by the hight of the water column, and the labor actually performed, is as 100:82; or the loss of labor amounts to 18 per cent., half of which is due to the engine itself and half to the pumps worked by it.

These engines are sometimes used for hoisting purposes. Armstrong, in his water columu cranes, uses a single acting engine to lift the weight and double acting horizontal one to turn the crane.

The advantages of these engines over steam engines and turbines in localities where there is plenty of water, with a high fall, are obvious. The expense for building the engine is not greater than to build a steam engine; the expense for constructing water reservoir and supply pipes, if the circumstances are not unusually unfavorable, hardly come up to the cost of a boiler; their running expenses are trivial, compared with those of a steam engine, as they neither require fuel nor a high paid engineer; a common laborer being sufficient to attend them. For repairs they do not cost half what steam engines do. Compared with water wheels and turbines, they are dearer to build; but, as already mentioned, the loss of power in these engines, through friction and loss of water, is only 18 per cent., while in turbines of the best construction it is not less than 30 per cent.

Some of these engines are employed in the mines of England and France; but principally they are used in the silver mines of central and southeastern Germany, where there is usually plenty of water with a high fall.

Two Frenchmen built, as early as 1731, a sort of a water pressure engine, but the water had a fall of nine feet only, and as it seems not to have worked well, the attempt was abandoned. We next meet with water column engines about the beginning of this century, when German mining engineers commenced using them, and who have ever since continued more favorable to them than the engineers of any other nation; probably because the conditions for their working are more favorable in their country; this accounts also for the fact that the French and English scientific literature is so very poor as regards these engines. Our own literature has nothing at all about them.

Most respectfully yours, H. H.

New York, Jan. 3d, 1865.

REMARKS.—Our correspondent is evidently not aware of the inventions of Hansbrow & Redding, of Sacramento, and of McAuley & Wheeler, of this city. The former named gentlemen have invented and put into most successful operation a reciprocating hydrostatic engine, which completely obviates the serious drawbacks which had previously interfered with the successful working of water engines for general motive purposes. By the adoption of ingeniously contrived air chambers, the water is worked by this engine, with quite as much elasticity as steam. One of these engines of 20 horse power, capable of being worked up to 300 revolutions per minute, was exhibited at the late Industrial Fair, in this city. It was fully described on page 167, of Volume IX, of the MINING AND SCIENTIFIC PRESS. McAuley & Wheeler, of this city, exhibited at the same time with the above, what may be termed an hydraulic rotary engine, constructed to obtain its power from the pressure of a column of water, after the same manner as the engine of Hausbrow & Redding, but entirely dispensing with valves. It was fully described on page 391, Vol. IX, of the MINING AND SCIENTIFIC PRESS. Either of these engines will work up to as high a per centage as those noticed by our correspondent, in addition to possessing the advantages noticed above, the lack of which, present such serious drawbacks to all the European water engines. It can no longer be said that "our own literature has nothing at all about" water engines. California has supplied the deficiency.

Formation of Clay Walls and Seams in Mineral Veins.

Few mineral veins of any size can be found that do not contain clay seams, and that do not show a stratum of clay on one or both walls. This is a well known fact. All know that these seams and strata of clay are natural to every large and regular vein. But all do not know why the presence of these strata of clay may be confidently looked for in such leads—do not understand how they came in the lead. Most persons suppose them to have been formed at the same time as the leads which they accompany and to be coetaneous with them. This is not the case. The formation of clay seams either within the body of quartz veins or outside next their walls begins after the deposition of the quartz composing the lead. In some respects, this is a creaking old world—this rolling ball of earth we inhabit. Its joints are subject to movements—they "work"—in a manner similar to those of a ship when tossed by the sea—though, of course, so gradually as to be imperceptible, except by effects. Where extensive crevices have been opened by earthquakes, the sides have frequently been observed to have risen up or settled down till there is often a difference of several feet to be seen in the surface on the opposite sides of the crevice. After sinking for ages, the ground may again rise and again sink, and so on *ad infinitum*. Quartz veins are extensive crevices of the same character—earth's joints—and in them the same grinding mechanical action takes place; and thus by the attrition of the vein against its walls, or one part of the vein against another part, the opposing surfaces are reduced to a pasty mass, and a seam presenting the appearance of clay is formed of the triturated materials. Take two flat pieces of sandstone, wet their surfaces and rub them together a few minutes, and a miniature clay seam is formed between them. This is precisely what occurs in a mine, though the surfaces opposed are pressed together by a force exceeding billions of tons, and the motion is so slow as to be imperceptible. The clay seams thus formed are invariably striated, thus showing plainly the direction of the motion to which they owe their origin. Mingled with the clay of these seams, quartz, granite and other pebbles are always found, many of them ground down to a state of smoothness and polish rivaling that of the pebbles of a brook. We have taken such pebbles from a clay seam in the Savage mine at a depth of 365 feet below the surface. The clay seams of a vein are generally composed of the same materials as the rocks with which they are found in contact. The reader will therefore at once surmise that clay seams may very frequently contain a considerable amount of metal. This is always the case where a part of the vein containing a deposit of ore is brought in contact with its wall or another portion of the lead, and is thus reduced by attrition. The clay seams in auriferous veins generally contain a considerable amount of gold, which may readily be obtained by washing. In silver-bearing veins the same rule holds good. A certain portion of a large clay seam in the Savage mine is astonishingly rich in silver, assaying no less than $700 per ton. In another portion it contains rounded lumps, or pebbles, of black sulphuret ore—some of them weighing two or three pounds—of the very richest description. The world rolls round, a creaking grinding mass; we don't hear it creak nor see it grind, but all endowed with reason may both hear and see in results.—*Enterprise.*

A FORTUNATE INVENTOR.—The enormous demand that has sprung up for the series of dyes that are prepared from coal, bas probably no parallel in the history of color manufactures. Mauve, magenta, girofila, and other popular colors, are all produced by scientific treatment of certain substances that are produced during the distillation of coal. The inventor, or perhaps we should say the discoverer, of these dyes, was a lad in the City of London School, now grown to man's estate, and enjoying an income of several thousands a year, as his share of the profits of the manufacture of these dyes.

IT is proposed by some English capitalists to go into the business of raising ostriches at the Cape of Good Hope, for the sake of the feathers, which may be plucked every six months. Each plucking of feathers will be worth from £10 to £15 for each bird.

MOVING WITH THE PLANETS.—In its divinest inspiration, Genius never uttered a more audaciously sublime sentiment than was embodied in the simple sentence of Sherman

Mining and Scientific Press Patent Agency.

SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, And if the final fee for such patent be not paid within the said six months, the patent shall be void, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a full specification, model, duplicate drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there exists any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it enables the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensue. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications filed in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorneys, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to the order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we forward them for signature by mail, for examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it be one of great complication, as the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oilcloth, prints, paper hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and validity of patents covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the Judges of the U. S. Court of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, Government House, corner Sansomo and Washington streets, San Francisco.

THE MINERS' QUARTZ MILL AND AMALGAMATOR.

Mr. Samuel Fair, of this city, who has been familiar with the working of quartz-mill machinery for the last ten years, has of late been devoting much time to the invention and perfection of a set of machinery for reducing quartz, and amalgamating and separating the precious metals therefrom, upon a principle entirely different from that ordinarily employed either in stamping or crushing. He has taken for his idea, the ordinary bark mill, which consists of an outer, cone shaped stationary shell, armed upon its inner surface with teeth, within which a solid cone, conformable in shape to the outer shell, and also armed with teeth is made to revolve.

In applying this principle to grinding quartz, both the outer shell and inner cone is cast so as to retain their armament in four circular sections, the first and second gradually approaching each other, and the third and fourth so arranged that while the opposite grinding surfaces are brought closer together, the area of that surface is enlarged in the same proportion as the upper half is contracted, giving to the entire arrangement the shape of an hour glass. The fourth and last section is not armed with teeth, but, when cast, both the die and the burr present a smooth surface, into which several longitudinal slots are ploughed, and subsequently filled with soft iron or wood. The advantages of this arrangement for fine and rapid trituration are familiar to all millmen.

In the upper portion of the machine, the dies, which are attached to the outer shell, are kept stationary, while the burrs, which are slipped on to a central revolving shaft, running perpendicularly through the machine, are allowed to run loose, being kept in position by their weight. The dies and burrs of the lower portion of the machine are affixed upward from below, and so arranged, by set screws, that they can be made to grind fine or coarse, as may be desired. They are capable of being made to grind quartz to an impalpable powder. The entire arrangement is extremely simple and effective. The dies and shoes, the only portions which are subjuguted to any considerable wear, for a machine capable of grinding three tons in twelve hours, weigh but seventy-two pounds, and the machine may be driven by a two-horse power.

Although the machine has not yet been subjected to any very continuous work, yet the inventor is so well satisfied of its capacity that he will immediately put one up upon a mine in which he is interested in Santa Cruz county, where it will be subjected to a thorough practical test, the result of which has been promised us for publication.

Another of these machines will be put up in the course of the coming week, at the Golden State Foundry, for the purpose of grinding coal and fire-brick for foundry purposes, where the operation of the machine may be seen and studied, although it will not there be subjected to the wear and tear which it will meet with at the quartz mine. We shall watch, with interest, this new effort to introduce a substitute for the cumbersome and expensive stamp machine. If it answers the expectation of the inventor, he will give a full and accurate illustration of its mechanism in the columns of the MINING AND SCIENTIFIC PRESS. We wish him the fullest measure of success.

A HAND AMALGAMATOR.—Mr. Fair has also devised, and has now in operation, in connection with the above, at 313 Market street, below Fremont, a hand amalgamator, capable of receiving a working charge of thirty pounds, which may be readily operated by a crank. It consists of a wooden cylinder, in which sets a simple die, occupying a little over half the inner circumference of the cylinder. Within this a set of angular shaped mullers, extending across the cylinder and attached to a horizontal shaft, is made to work. In the bottom of the cylinder is a steam chamber, containing a place of inlet and another for the outlet of steam, which may be taken directly from a common camp kettle, upon which a tight cover is fitted with a conducting tube leading to the amalgamator. It will thus be seen that this amalgamator may be employed with all the advantages of steam, in any miners' camp. Amalgamators of a capacity for working 500 pounds will soon be in the market.

Mr. Fair will also soon have small sized reduction machines, after the pattern above described, for reducing, by hand, about 300 pounds in twelve hours; the iron work of which will not weigh over 150 pounds. The iron work of the hand amalgamator will weigh about sixty-five pounds and the wood work as much more. The whole outfit, complete, only weighs 280 lbs. to grind and amalgamate 500 pounds in twelve hours. The cost of both will not exceed $250 in this city.

A CALIFORNIA STOCK BOARD IN NEW YORK.

We learn from a private correspondent that the attempt to establish a California Stock Board in New York, came near being prevented from its legitimate purpose, by an effort on the part of a few individuals connected with the movement to convert the same into a stock jobbing concern, for the purpose of palming off upon the New York public a lot of California "wild cat," which was found to go heavy in that market.

It appears that a large party of influential gentleman, in that city, who had come to the conclusion that a substantial *bona fide* stock board, conducted with the honest motive of representing California, Nevada and Colorado mining stocks as they should be represented, and excluding "wild cat" and all stock gambling operations, would be greatly advantageous to both buyer and seller, came together for the purpose of taking action in the matter. At the second meeting it became evident to the more substantial portion of those present that there was a party strong in numbers, who were determined to make the organization a medium for introducing to the New York public all manner of mining trash, and to serve as an engine for "bulling and bearing" their favorite stocks. Those who desired to operate in a legitimate manner promptly withdrew from the meeting as soon as this phase was made manifest, and at latest dates were taking measures to establish a Board, which should carry out the designs of the original projectors of the enterprise. Prominent among those engaged in this last movement we notice the name of our former fellow citizen, John W. Warren, Esq., "Frank Wardell" of the MINING AND SCIENTIFIC PRESS and well known to the business community of San Francisco. If our information on this point is correct, it is highly creditable to the gentlemen engaged in this last movement that they have taken such a stand, which, we trust, will contribute to a fair and honest representation of California mining stocks in New York. The necessity of a properly managed Board to represent our mining interest there is quite apparent to all who are posted to any considerable extent in the manner in which these valuable interests are damaged by the worthless "wild cat" stocks which are being palmed off in that city as genuine and legitimate. The name proposed for the new Board is the "California, Nevada and Colorado Board of Brokers."

STRENGTH OF MATERIALS.—It is a remarkable fact, that of the most abundant material in nature, iron is the strongest of all known substances. Made into best steel, a rod one-fourth of an inch in diameter will sustain 9,000 lbs. before breaking; soft steel, 7,000 pounds; iron wire, 6,000; bar iron, 4,000; inferior bar iron, 2,000; cast iron, 1,000 to 3,000 pounds; copper wire, 3,000; silver, 2,000; gold, 2,500; tin, 300; cast zinc, 160; sheet zinc, 1,000; cast lead, 55; milled lead, 200. Of wood, box and locust, the same size, will hold 1,200 pounds; the toughest ash, 1,000; elm, 800; beech, cedar, white oak, pitch pine, 600; chesnut and soft maple, 650; poplar, 400. Wood which will bear a very heavy weight for a minute or two, will break with two-thirds the force acting a long time. A rod of iron is about ten times as strong as a hemp cord. A rope an inch in diameter will bear about two and a half tons, but in practice it is not safe to subject it to a strain of more than about one ton. Half an inch in diameter, the strength will be one quarter as much; a quarter of an inch, one-sixteenth as much, and so on.

WORKING SULPHURETS.—Mr. Samuel Fair, of this city, whose new mining machinery is elsewhere noticed in this issue, has been for some two years experimenting upon auriferous sulphurets. He informs us that he has now brought his process to the necessary degree of perfection to warrant its being placed before the public. This will be done as soon as the necessary steps have been taken for securing his interest in the same by letters patent. The process is represented as simple, effective and cheap. The cost of chemicals and manipulation will not exceed $3.50 per ton, when the gold may be separated from the residue as readily as it can be done after roasting. Mr. Fair's process is merely the substitution of a chemical method of getting rid of the sulphur instead of the mechanical one of roasting, which he claims can be done much cheaper. The ordinary roasting process costs about $20 per ton in this city, with wood at $10 per cord. If Mr. F. can do his work equally well for double the cost he names, he can take the market.

NEW PAPER.—We learn, through a private letter from New York, that Mr. Collins, publisher of the Virginia City Directory, is now in New York City, where he proposes to establish another weekly paper, to be "devoted especially to the interests of California."

[ADVERTISEMENT.]

To the Public, and to Millmen in Particular.

As Thomas Varney has not, up to this date, withdrawn his notice in the "Mining and Scientific Press," in which appears the following language:—

"All persons are warned against purchasing machines made at the Miners' Foundry, called 'Wheeler's Amalgamators,' as they are an infringement on my patent, and a suit is now pending in the United States Circuit Court, against the parties infringing;"

In justice to myself I am compelled to give to the public a statement of the facts in the case, and show the position which Mr. Varney and myself occupy as Patentees. He commenced suit against me, and the Miners' Foundry, for $90,000, about the 1st of March 1863, and threatened suit against any and all persons who should buy my amalgamators, thus greatly damaging my business. To show the injustice of this suit against a "poor hard working mechanic," I will quote from the opinion of Judge Hoffman, as rendered in the case last November. He says:

This is an action for the infringement of a patent issued to the plaintiff on the 16th of December, 1862, for an "improvement in Amalgamators for gold and silver." The machine alleged to be an infringement has also been patented—the patent being dated December 8th, 1863. The defendants deny the alleged infringements, and the novelty and originality of the plaintiff's invention. They have also given notice, under the statute, of various other defences, hereafter to be noticed.

Models of the two machines were exhibited in Court, and a large number of witnesses called to explain their construction and mode of operation. It is apparent that the patented machine of the defendant closely resembles, it it be not substantially identical with, the improved and modified machine now manufactured by the plaintiff. But the inquiry is not whether Wheeler's machine resembles that lately used by Varney, but whether the former is substantially the same as the machine described in Varney's patent. That Varney has, in many important particulars, modified the machine as described in his patent, is obvious. Indeed, his late machines resemble much more nearly in external appearance, and in their mode of operation, the Wheeler patented machine than they do a machine constructed according to the drawings and specifications of his patent.

After describing Mr. Varney's pan and its operation, the Judge says:

It appears, however, that the idea of working ores in a batch, by causing them to pass repeatedly between mullers, the upper one of which is provided with openings at the center, is by no means novel.

J. E. Chiyton testifies that, so long ago as 1845, he arranged a machine in Tallaboosa, Alabama, for the reduction of gold ores, which embodied substantially the same principle.

* * * * * * *

In Overman's Metallurgy, p 267, a similar arrangement is described. * * It is evident that the author is here describing an existing and well known machine, the usefulness of which has already been ascertained.

It is also apparent that the result aimed at is the same in this machine as in that of the plaintiff, and that the means adopted to accomplish it are substantially similar. In both machines the pulverization of the ore is effected by means of a bed plate upon which a muller rotates, with central openings to permit the pulp to pass continuously and repeatedly between the grinding surfaces until the operation is completed.

Amongst other things the Judge quotes the following from Judge Story:

But in all cases where the patentee claims anything as his own invention in his specification, Courts of law cannot reject the claim, and if included in the patent and found not to be new, the patent is void, however small and unimportant such asserted invention may be.

* * * * * * *

Here the plaintiff claims a particular position of machinery as his invention, and it clearly appears in evidence that the position is not new. It has existed before—not in machines exactly like the present, but in machines applied to analagous purposes, viz: in machines applied for the same purpose as the plaintiff applies them. The objection therefore, is fatal.

In the defendant's machine, the pan in two parts, provided with flanges, packing, &c., to which the plaintiff in his patent attaches so much importance, is not used, but a deep pan is substituted with a wooden cover.

The arrangement of the slots or shoes of the muller is different. The upper muller is provided with spiral ridges arranged to operate with similar ridges reversely inclined on the inner surface of the pan, to raise the pulp and promote the circulation. The upper muller is attached to the shaft by an universal joint, and by a mechanism quite dissimilar to that described by the plaintiff. And for the scrapers are substituted broad guide plates extending and secured to the edge of the pan, and capable of being elevated or depressed by means of a mechanism not found in the plaintiff's machines.

Assuming then—as in the point of view in which we are considering it we must—that each of the several parts of the plaintiff's machine is old, and not separately patentable, it seems clear to me that if the patent for the machine can be sustained, as for a new combination; which I think doubtful, the combination of the defendant is at least as novel as that of the plaintiff.

We have already seen that the muller rotating upon a bed plate, with central openings, and arranged in a pan so as to create a circulation of the pulp, is not a new invention. The tub, composed of two parts, with flanges, packing, &c., is not claimed to have been used by the defendant. In fact it is now discarded by the plaintiff, and a deep pan, with muller attached by an universal joint, has been adopted by him in his later machines. The infringement, if any, must consist in the use by the defendant of the scrapers described in the plaintiff's patent.

The inquiry thus arises—are the curved plates described in Wheeler's patent, substantially the same in their structure and operation as the scrapers of the Varney patent, and if so, do the latter constitute a "material and substantial part of the things patented by Varney, definably distinguishable from the other part." To determine this question, a brief description of Wheeler's machine is necessary.

The Judge then describes the Wheeler pan and the Varney pan and scrapers, and says:

In the Wheeler pan four plates are used while Varney employs only two scrapers. The form or curve given to these plates in both machines is similar, though not identical; but in their structure, arrangement, and the use for which they are intended, there is an essential difference. The scrapers of Varney are represented as of inconsiderable width, and extending from a ring at the center to the periphery of the muller—they rest apparently upon the surface of the muller, and no means of elevating or depressing them are mentioned in the specifications or exhibited in the drawings.

The plates of Wheeler are of considerable width, and attached to a frame suspended from the top of the shaft, resting upon a vertical screw, by means of which the frame and plates attached to it may be elevated or depressed. The plates extend to the inner surface of the pan, where they are secured by slides. The office of these plates, as described in Wheeler's patent, has already been mentioned. It appears to me that the scrapers of Varney neither serve, nor were intended to serve, any such purpose. [Here the Judge gives his reasons for the above opinion.]

For these reasons I am of opinion that the curved plates of Wheeler differ from the scrapers of Varney in their form and arrangement, their object and effect, and that therefore their use is not an infringement of Varney's patent.

Much testimony was taken to show that in fact Wheeler's invention was prior to that of Varney's and that the latter derived his ideas from the former.

It is claimed by Varney that his invention was, in its essential features, matured and perfected in August, 1861. But this statement seems hardly consistent with his declarations or his conduct.

Varney's application for his first patent was not made until the end of October, 1861. That machine has since been discarded as useless.

If then, at the time of this application, he had already matured and perfected the invention of another and far better machine, he committed a practical fraud upon the public in withholding from them the benefit of his skill and ingenuity. It is certainly strange that he should have gone to the trouble and expense of procuring a patent for his first machine, and delayed, for nearly a year, his application for a patent for the improved machine which he had, as he says, already invented.

It may well be doubted whether, if it be true as Varney states, that at the time of his application for his first patent he had already completed and perfected his improved machine, the suppression would not be fatal to both. It appears in evidence that, so early as December, 1861, Wheeler had conceived and communicated to Stewart & Kirkpatrick at Washoe, the idea of his machine. He explained to them the mode in which the circulation, or over and under current was to be produced, and the guide boards by which it was to be assisted.

In January, 1862, drawings of this machine were received at the Miner's foundry, and Stewart, the partner of Churchill, was desirous of having his pans constructed on that plan. The theory and construction of the proposed pan were fully explained to Varney, who succeeded, however, by affecting to consider Wheeler's pan a "humbug," in dissuading the parties from adopting it, and in inducing them to order pans made on the model of his own patent. These were subsequently discarded as useless. We are driven to adopt one of two suppositions: either that Varney wilfully deceived Stewart in inducing him to order an inferior pan, or else that he had not at that time discovered the mode of producing the over and under current, recognized its utility and invented a machine to effect it.

Wheeler commenced manufacturing his machines in January, 1862. He commenced using them in June of the same year. They were constructed at the Miners' Foundry by the defendants to this cause, under the immediate observation of Varney. But in his conversation with Scott, in July, 1862, and in his communications with the defendants, he does not appear to have intimated that he was the first inventor of the Wheeler machine, and that in constructing the latter they were violating his rights. Up to the end of 1862, he continued to have his own pans built at the same foundry; and it he really considered the construction of Wheeler's pans to be an infringement of his own invention, his silence is inexplicable. His delay in applying for his second patent is equally unaccountable. In August, 1861, he had, as he says, completed and perfected his invention of his improved machine, and yet in October of that year he applies for a patent for his first and imperfect invention, and delays his application for a patent for his improved and perfected machine until the end of June, 1862—more than a month after Wheeler had taken the preliminary steps to obtain his patent.

It is unnecessary, however, to pursue this inquiry further, for in the view I have taken of the case the question of priority of invention is immaterial.

The Judge then notices the other grounds of defence, and says:

If this view of the effect of that statute be correct, it affords a defence to Wheeler as well as the other defendants. It is not pretended that he has used any machines not manufactured by them, or that he has infringed the plaintiff's rights, otherwise than by receiving from the other defendants the sum agreed to be paid by them on the sale of his machines.

I find, therefore, for the defendants.

[In this candid statement to the public, I should have preferred to have given the decision of the Judge and the findings of the Court in full, but for the great length of space they would occupy; and I will state that the same can be found in the "Mining and Scientific Press," of December 10th and 31st, 1864, and invite their thorough perusal.]

It will be seen by the above statements that Mr. Varney is infringing on my patent right by the use of wide guide plates in his pans, instead of my infringing on his patent. The truth is, he never used any but narrow scrapers in his pans until after I had put my pans in operation, and they had proved a success. None of his pans made prior to the year 1863 ever ran six weeks without being condemned and thrown aside. This may account for the fact the he afterwards altered his patterns and made them like mine, with an open, deep pan, and wide guide plat s instead of scrapers, and put a wooden cover on the pans.

Having established my right in my patent Amalgamator, it is now my turn to protect myself against the infringement of "Mr. Varney, or any other man," and I intend to do it; and all persons are hereby warned not to purchase or use machines called "Varney's Amalgamators," as made at the Union Foundry, Pacific Foundry, or any other place, as they will make themselves liable for an infringement on my patent right.

Having made some important improvements in my Amalgamators, the public are invited to call and examine them at the Miners' Foundry, San Francisco, or at Prescott & Schiedel's Foundry, Marysville, where they are manufactured. ZENAS WHEELER.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Wm. R. Bradshaw—San Joaquin, Calaveras, Merced, Tuolumne, Stanislaus and Mariposa counties.

Mr. Robert Lattimore—Butte and Yuba counties.

J. M. Wolf—Sacramento, Placer and El Dorado counties.

[Written for the Mining and Scientific Press.]

Letter from Coulterville.

MESSRS. EDITORS:—A week ago I left Chinese Camp for this place, intending to come *via* Oak Flat. Finding that there were no stages on that route I started on foot, carrying my valise *a la* Yankee pedler, of the oldeu time. The first four miles were over a country pleasantly diversified by hill and valley, and showing but little indication of mineral wealth. This distance brought me to Jacksouville, situated on the Tuolumne river, at the mouth of Wood's Creek. Here there has been much placer mining at some time in the past, but at present everything shows signs of decay. A set of idle looking fellows were lounging around a store as I came in, and on my inquiring the distance to Oak Flat, one of them asked—"I say, air yu goin up to the Flat to get work? Ef you air, yer migbt as well stop, for its awful dull up there." I thanked him for his kiud advice, assuring him that if I could only reach the Flat I should have no difficulty in finding employment of some kiud. The road from here to the mouth of Moccasin Creek, winds aloug the banks of the Tuolumne river, the bluffs of which are steep, of slate formation, intersected by numerous ledges, the croppings of which indicate the presence of copper, to an extent which left no doubt of their having been the cause of much excitement in the neighborhood a year ago. Crossing the Tuolumne at the mouth of Moccasin Creek, the road follows the latter stream; the bed and banks of which have once been the scene of much profitable placer mining, but which are now given over to the Indians, and Chinese.

Some time after dark I arrived at Munn's store, where, on showing my card, I met with a most hospitable welcome. Mr. M. had just returned from San Francisco, where he had been negotiating for the sale of some valuable copper interests, and had met with gratifying success. He had seen copies of the PRESS while in "the city," and was glad of an opportunity to subscribe. He showed me some specimens of copper pyrites taken from the claims he had been selling, which appeared very rich. The croppings indicate a very wide vein, but as yet there has not been any ore taken out rich enough to pay for shipping. The company who bought the claim have shown by the price paid, ($30,000,) that they have confidence in the vein, and will doubtless prospect it thoroughly and well.

Three miles walk, all the way up a steep grade, brought me to Oak Flat, "the most elevated camp in the Southern mines." Here I was cordially received by Mr. Urish, postmaster and agent for Wells, Fargo & Co., who did everything possible to make me at home, and proposed that we should go together in the afternoon to look at the new quartz mill at Deer Flat, about a mile distant.

After a short rest and a good dinner at Kenney's Hotel, we set out, and after a walk of fifteen or twenty minutes found ourselves at the Nonpareil quartz mill. Here we were politely received by the Superintendent, Mr. Duprat, who very kindly showed me his mill and machinery, and some rich specimens of rock which had been taken from the mine that day. There are five stamps running, and a battery ready for five more, which Mr. D. intends soon to put up. The power is furnished by a water-wheel of the Fauchery pattern, six inches in diameter, using twenty inches of water, under a pressure of three hundred and fifty-three feet. This power, Mr. Duprat says is sufficient to drive twenty stamps. He is using Farrand's amalgamator, which works to his entire satisfaction. The vein of quartz which furnishes the rock for this mill is about twenty inches wide. The rock is of a reddish hue, easily crushed, and pays over fifty dollars per ton. This vein has been opened to a depth of eighty feet, and seems to improve as it goes down. The course of the vein is east and west, with a dip to the northward of twenty-nine degrees from a perpendicular.

There are many quartz ledges in the neighborhood of Oak Flat, which, I think, will pay if properly worked, and the people are beginning to awaken to their importance, now that the placer mines have failed. Several veins are being prospected with energy and success. Foremost among these is the Big Creek vein, situated some five miles east of Deer Flat, and owned by Messrs. Jackson and Pollard, which I visited in company with Mr. Garner, of Deer Flat. A tunnel has been run for three hundred feet into the hill, cutting the vein at a depth of one hundred and twenty feet. The vein is about four feet thick, and consists of two parts—that next the hanging wall formed of a reddish colored, brittle quartz, carrying a large amount of free gold, while on the lower side the quartz is white, hard and strong, and abounds in sulphurets of iron and lead. Between these two parts is a stratum of talc, about six inches thick. This vein, like others in this vicinity, runs in an easterly and westerly direction, but differs from most of them in dipping towards the south.

It rained nearly all the time of my stay in Oak Flat, and my frequent reconnoisances brought me many a wetting, but these were fully repaid by the interest of the trip.

On Thursday morning I met Mr. Priest of Pina Blanca, who invited me to accompany him to his mine at that place, some six miles from Oak Flat, and just on the line between Tuolumne and Mariposa counties. This mine has been worked for several years by different parties, and always with reasonable profit, though no continuous vein has yet been opened, yet many pockets of very rich rock have been found—one of which has been opened to a depth of five hundred feet. He has a ten-stamp mill, of a rather ancient pattern, driven by an overshot water-wheel, fifty feet in diameter. After enjoying the hospitality of Mr. P. for the night, I came, in company with him, to this place. The rain has, thus far, prevented my making observations here, but I hope to be able to chronicle much that is of interest when the sun shines out again. D.

Coulterville, Feb. 18, 1865.

MECHANICS' INSTITUTE NOMINEES.—The committee appointed to report a list of candidates for officers of the Mechanics' Institute for the ensuing year, have reported the following list of nominees: President, Charles M. Plum, upholsterer; Vice-President, J. Moulton, painter; Corresponding Secretary, C. S. Higgins, iron-founder; Recording Secretary, P. B. Dexter, miller; Treasurer, Edward Nunan, builder; Directors, A. A. Snyder, builder; H. R. Cummings, commission merchant; D. Farquharson, architect; J. B. Dean, painter; David Dwyer, coal dealer; M. A. McDonald, mill man; J. W. Reay, tin and sheet-iron worker.

The above will be considered the "Regular Ticket." A meeting has been called of those opposed to the above nominations, to be held at the Reading Room of the Institute, this evening, to nominate an "Opposition Ticket."

Mining Summary.

CALIFORNIA.

The general and continued activity in mining manifested everywhere throughout the State, is a happy augury of a successful mining season. The drought of last summer appears to have had a marked effect in turning the attention of many heretofore engaged in the placers, to the more permanent business of quartz mining. All things considered, we think that present appearances fully warrant the belief that the recent complaint of hard times was but the darkness which proverbially precedes the coming of the brightness of day.

SHASTA.—Under the head of "The Mines Played Out," the Shasta *Courier* speaks of a claim on Middle Creek, from which four pans of rock, crushed in a hand mortar, yielded four ounces and eight pennyweights, and still continues to pay nearly in the same proportion. Another in nearly the same vicinity, pays from a quarter to one ounce to the pan. The Highland mill has made another ten days' run, and cleaned up $4,829.78. Preparations for the erection of two other mills at French Gulch are being made.

FROM COPPER CITY.—The Red Bluff *Independent* learns that the Bully Hill Company have struck a vein running parallel with the main lode, about one foot wide. The Original Williams & Killinger had no sale—not a single stockholder was defaulter in assessments. The Secretary of the Bully Hill says that he anticipates the same result for that company.

KELLY'S MILL IS RUNNING.—The amalgam daily produced from working Kellinger and Bully Hill rock, and bullion from the former, gives ample evidence of the richness of that mineral region.

TRINITY.—The *Journal* learns that the miners are doing well in the Rattlesnake district. Schneider & Kiefer have a valuable ditch, which covers an extent of good mining ground not surpassed in Trinity. Phillips & Co. are working two parties, sluicing off top dirt, and occasionally pick up "slugs" weighing from $15 to $25. Gomez & Co. are doing well on a high bar, though much annoyed by the tremendous boulders. Bradley, Brand & Co., Wilms and John Cords have plenty of water and are making good wages. The Fenning Bros. and Lassiter & Co., on Grizzly Fork, are averaging from $8 to $10 to the hand. Confidence is daily increasing in the richness of the Ludwig Ledge on East Fork. Some as rich specimens of gold-bearing quartz as we have ever seen, have been taken out within the past two or three weeks.

PLUMAS.—The *Quincy Union* learns from Genesee Valley, that all the ledges in that section are being worked. Kitts & Co. are opening the Oriental and Occidental ledges on shares. These ledges are considered No. 1 copper ledges. The asbestus rock, used in the furnace of the Smelting Works, stands the test of fire better than it was supposed it would.

SIERRA.—The Downieville *Messenger* says that Gard & Orr have purchased the interest of the Hills in the Feather River Ditch, and the interest of McCreery in the mining claims of the La Porte company.

The American Hill Quartz Co. cleaned up a few days since, after a month's run, and found the nice little sum of 256 ounces and 17 pennyweights.

William Mazerva, who went prospecting for a few days up Slug Cañon, struck a handsome slug of gold, which was found to weigh seven and a half ounces.

The *Messenger* says Eureka is a fine place, although no work is being done there at present, on account of the want of water, but the prospects are that more money will be taken out in the spring than at any time for the last three years. An unusually large amount of dirt has been run off, and when the bottoming up is done, we may expect times to be as lively as in its palmiest days.

The Union company have dispensed with their steam engine, and are now using Fredenburg's patent water power, at a saving to the company of at least four hundred and fifty dollars a month. The *Messenger* says that every one engaged in mining, or anything else, where a motive power is required, and where from four to ten inches of water can be procured, with from 80 to 120 feet fall, should see the working of the Fredenburg patent, to be convinced beyond a doubt of its utility, cheapness and durability. The Union Company is located at Howland Flat.

EL DORADO.—Considerable excitement is existing in El Dorado and Placer counties, at this time, with regard to recent discoveries of silver. Some specimens of silver ore have been exhibited in Folsom, from the Lane claim, lately discovered near Rock Springs, about five miles distant from the former place. The native silver is plainly seen.

AMADOR.—The Amador *Ledger* says that the Scottsville quartz mill has again been put in operation. The mill is now crushing rock from the old Moore lode.

The Merced *Banner* learns that the stores of the Mariposa Company, in Mariposa, Princeton, and Bear Valley, still remain closed, and that the affairs of the company are apparently no nearer adjustment than they were two weeks ago. A great portion of the miners have quit work, and are selling their scrip for 50 and 75 per cent.

CALAVERAS.—We gather the following items from the San Andreas *Register*:

Col. Frazier and his partner, at Washington Ranch, a few days since, washed up 200 ounces of gold from dirt which they have been drifting during the past season.

Two miners have struck a rich claim near Chile Junction, where they have been taking out the gold at the rate of $100 a day, finding coarse pieces from one dollar to ten.

Three miners at El Dorado have been taking out the gold by the pound, having taken out $15,000 in six days, which is at the rate of over a pound a day. They found one piece which weighed over three pounds.

The workmen in the Buckfield Copper claim have struck the perpendicular wall of the main lead, into which they have worked two feet, and are not through it yet. The rock taken out is fine shipping ore.

Mr. McFall, who has been at work for some time past, running a tunnel to drain the claims above his, has got through. This will give employment to a number of men, and add very much to the business of the place, as those claims are known to be rich, and can now be successfully worked.

SENSIBLE.—The Shasta *Courier* suggests to some parties about to erect two or three quartz mills in that vicinity, that before purchasing machinery, they send a competent man, in whose judgment they can place implicit confidence, to examine the latest improvements in quartz milling, and be governed by what he may see and learn of the progress made in that line. The *Courier* thinks that mills are being built there which do not sufficiently crush the rock. "Machinery that will completely pulverize the quartz is the kind we want. When it is allowed to pass off crushed only to the fineness of ordinary sand used for plastering purposes, it must be palpable to every observer that there is a waste of gold. When gold as fine as flour is distributed through rock, it seems certain that the rock should be ground as fine as flour in order to get it out."

NEVADA.—The Nevada county papers still continue to chronicle new strikes, and important developments in the old ones. We condense the following: A fine ledge has recently been struck in the vicinity of Selby Flat, Nevada county.

Six tons of rock from Eddy & Co.'s quartz claim at American Hill, crushed at Palmer's mill, yielded $472.86, or $78.81 per ton. The sulphurets will probably give a large additional yield. Some magnificent rock is being taken out of the Gold Tunnel Company's ground, at the lower level. The rock is very heavy, and looks like it would turn out big pay. They are now down one hundred and five feet below the bed of the creek, and are taking out rock very fast. Charles Robinson has discovered and located a claim on Red Hill, beyond Wood's Ravine, which promises to be immensely rich.

Eddy & Co., of French Corral, recently cleaned up, from two weeks' washing of dirt from their hydraulic claims, the sum of thirty-two thousand dollars.

The Grass Valley *Union* says that another rich strike has been made within one and a half miles of Grass Valley, by Messrs. Evany, Aldersy & Barney. They have now about forty tons of rock at Laramies' mill. This is one of the leads there is no mistake about; seven buckets full of specimens have been taken out. Gold is visible to the naked eye throughout the vein, and it pays from the surface down.

Autry & Co. have struck a rich ledge in Woodpecker Ravine. The Howard Hill clean up, after a four days' run, was 675 ounces. The Union Company cleaned up 478 ounces in about the same time, with eight stamps. The Forrest Hill Mill recently took out $15,000. This ledge is proving to be extremely rich. The Lincoln ledge, an extension of the Lafayette, is two feet thick at the depth of twenty feet. The *Union* says that "there has been none of this rock crushed yet, but judging from appearances, the owners of the "Lincoln" will reap a reward far above their present anticipations. This ledge is situated near Sanford's ranch.

WASHOE.

The steady increase of bullion shipments from the Eastern Slope, give promise of an improved future and permanent prosperity. These expectations do not seem to be based

upon speculation, but upon the sound basis of production. The amount of bullion now coming forward appears to be governed more by the facilities of mill power, than by the yield of ore from the mines. Many new mills will be put up during the coming year, which will create an additional demand for labor. We condense the following items from the local papers:

We learn from the Gold Hill *News*, that in the Imperial Company's mine, at a depth of 450 feet, in a drift branching north from the shaft, a rich deposit has been struck, and about two hundred loads are daily being raised from the mine. Also, that the Yellow Jacket company have opened the lower level of their mine, and with satisfactory results, the ledge growing richer the deeper they go down.

The Challar Company are at this time taking out a large amount of ore daily from their mine, giving employment to a large number of men. Favorable reports have of late been heard from the Challenge mine. The Croesus Company are now down 500 feet. They have a large vein, in which they have been drifting extensively, and in one or two places have struck fair ore, some of which they are now having crushed.

The Rock Island Company, on American Flat, has struck a ledge of very rich rock. The Justice mine also struck some rich rock, and others are daily expecting to develop something rich.

The Potosi Company are hauling off rock to the amount of three hundred tons per day, keeping several mills running night and day.

The New York and Washoe Mill, near Washoe City, on what is sometimes called Little Washoe Lake, has been for several weeks in successful operation. The mill contains twenty-four stamps, sixteen Varney's amalgamators, and eight separators. It is under the charge of Colonel D. E. Avery, general agent of the company. The mill is run on ore from Virginia City.

The Washoe *Times* says that the miners on the Truckee have been making new discoveries of rich silver ledges, within the past few weeks, distinct from those that are already being worked. Some have been found in the range east of Truckee Meadows, and still others north of Truckee river.

Morgan's forty-stamp mill on the Carson, near Empire City, is about ready to go into operation. It will contain all the latest improved machinery, and will be in every respect a first-class mill.

The new works erected by the Ophir and Mexican companies on the Mexican ground, will be started on the 19th inst., for the first time. The large pumping engine is not yet ready to start; it is the one for hoisting that will go into operation to-day. Everything, says the *Enterprise*, is most substantially constructed, and all has been done in an almost incredible short space of time. Flat wire cables will be used for hoisting, and the work of sinking the shaft will be pushed ahead with the greatest possible speed. Mr. Beckwith, the Superintendent, deserves great credit for the expeditious as well as excellent manner in which he has erected the new works.

Valuable Articles.—We would call the especial attention of our readers to the papers which we are now publishing on the subject of copper. They constitute the most valuable series of articles which have appeared in any journal on the Pacific coast, and should be read and carefully considered by every person interested in copper mining in California. They are worth to the copper miner more than an entire years' subscription to the Press.

We would also call attention to an article on Petroleum, which appears in our colums today. It bears the impress of a writer who is conversant with his subject, and is worth many columns of fine print from persons who write without any acquaintance with the subject upon which they seek to enlighten the public, and who seize the pen under the smart of pecuniary sufferings, inflicted upon them through ignorant charlatans, by whom they have been duped. We are no advocate of a petroleum *mania;* but we desire to see a full and intelligent discussion upon so important a matter as the petroleum interest promises to become to the future of California.

Not so Promising.—Cotton raising in Mexico does not promise to be as profitable as at first anticipated. Ginned cotton costs, when ready for shipment at Mazatlan, twenty-eight cents per pound in coin. Even at present prices of cotton in the East, this leaves little margin for loss, damage, cost of shipment, etc. When peace comes, the Mexican cotton growers will fall flat as a flounder.

Mining Law

Governing the Levying, Advertising and Collection of Assessments of Corporations.

The following is guaranteed to be a perfect copy of the new mining law of 1864, corresponding in word, letter and punctuation, with the official statutes issued by the State Printer. As first made up by the daily reporters, the law was rendered very imperfect; but the copy published in the Mining and Scientific Press June 25, 1865, was essentially correct.

AN ACT Concerning Assessments upon the Stock of Corporations.

[Approved April 4th 1864; Stat. 1863-4, p. 402.]

Section I. The Trustees of any corporation, formed under the general laws of this State, shall have power to levy and collect, for the purpose of paying the proper and legal expenses of such corporation, assessments upon the capital stock thereof, in the manner and form and to the extent hereinafter provided, and not otherwise.

Sec. 2. No assessments shall exceed five per cent. of the capital stock of the corporation, and none shall be levied while any portion of any previous assessment shall remain unpaid, or uncollected, except in cases where all the powers of the corporation shall have been exercised in accordance with the terms of this act, for the purpose of collecting such previous assessment, and except, also, the collection of a previous assessment against one or more stockholders, restrained by injunction or otherwise; in which case, further assessment may be levied and collected accordiag to this act.

Sec. 3. No assessmeot shall be levied except by order of the Board of Trustees, concurred in by a majority of said Board, and entered upon the records of the corporation.

Sec. 4. Every order levying an assessment shall specify the amount thereof and the time when the person or persons to whom and the place or places where the same is payable. It shall also appoint a day for the advertisement of the delinquent list, which shall not be less than thirty nor more than thirty-five days from the time of the making of such order, and a day for the sale of deliaquent stock, which shall not be less than ten nor more than twenty days from the time appointed for the advertisement of the delinquent list.

Sec. 5. Upon the making of such an order, the Secretary shall cause to be published immediately a notice thereof in the following form:

"[Name in full.] [Location of works.] Notice is hereby given that at a meeting of the Trustees of said Company, held on the [date], an assessment of [amount] per share was levied upon the capital stock of said Company, payable [when, to whom, and where, particularly]. Any stock upon which said assessment shall remain unpaid on the [day fixed] will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the [day appointed], to pay the delinquent assessment, together with costs of advertising and expenses of the sale. [Signature of the Secretary, with particular location of office.]"

Sec. 6. Said notice shall be published once each week for four successive weeks in some daily or weekly paper published at the place designated in the articles of corporation as the principal place of business of the corporation, and also in some paper published in the county in which the works of the corporation are situated, if a paper be published therein: *provided*, that if the works of the corporation are not situated within some State or Territory of the United States, then publication in a paper of the County shall not be necessary; and, *provided, also*, that if there is no paper regularly issued on Saturdays at any place where publication is required to be made, the notice may be published in every issue of the paper which is most frequently issued at such place, for the full period of four weeks; and, *provided, also*, that if there is no newspaper published at the place designated as the principal place of business of the corporation, then the publication shall be made in the newspaper published nearest thereto; and *provided, also*, that the notice specified in the 5th section of this act may be served by delivering a copy thereof, certified by the Secretary, to each stockholder personally, and in case of such service upon all the stockholders of said corporation, then no notice by publication shall be necessary, and such personal notice shall be deemed complete.

Sec. 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the secretary shall, unless otherwise ordered by the Board of Trustees, cause to be published in the same papers in which the notice provided for in Sec. 5 shall have been published, a notice substantially in the following form:

"[Name in full. Location of works.] *Notice.*—There is delinquent upon the following described stock, on account of assessment levied on the [date,] [and assessments levied previous thereto, if any,] the several amounts set opposite the names of the respective shareholders, as follows: [Names, number of certificate, number of shares, amount.] And in accordance with law, [and an order of the Board of Trustees, made on the [date,] if any such order shall have been made,] so many shares of each parcel of said stock as may be necessary, will be sold at the [particular place,] on the [date] at [the hour] of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale. [Name of Secretary, with particular location of office.]

Sec. 8. Said last named notice shall state every certificate of stock separately, with the number of shares which it represents, and the amount due thereon, except where certificates may not have been issued to parties entitled thereto, in which case the number of shares and amount due thereon, together with the fact that the certificates for such shares have not been issued shall be stated.

Sec. 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows: When published in a daily paper, the same shall be published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to the day of sale, the first publication in the weekly being at least fourteen days prior to the day of sale.

Sec. 10. By the publication of the said notices, as hereinbefore provided, the corporation shall acquire jurisdiction to sell and convey a full, complete, perfect, and absolute title to all of the stock described in the notice of sale upon which any portion of the assessment or costs of advertising shall remain unpaid at the hour appointed for the sale, but shall sell no more of such stock than is necessary to pay the assessments due and cost of sale.

Sec. 11. On the day and at the place, and as nearly as may be at the hour appointed in the notice of sale, the Secretary shall, unless otherwise ordered by the Board of Trustees, sell, or cause to be sold at public auction, to the highest bidder for cash, so many shares of each parcel of said described stock as may be necessary to pay the assessment and charges thereon, according to the terms of said notice of sale; *provided*, that if payment be made before the time fixed for sale, the party paying shall only be required to pay the actual cost of advertising.

Sec. 12. The person offering at such sale to pay the assessment and costs for the smallest number of shares, or fraction of a share, shall be deemed the highest bidder.

Sec. 13 The times fixed in any notice published according to the provisions, [of this act] may be once extended for a period of not more than ten days by order of the Board of Trustees duly made and entered on the records of the corporation, but no order extending the time for the performance of any act specified in any notice shall be effectual, unless notice of such extension or postponement be appended to and published with the notice to which [the] order relates before the completion of the regular course of publication thereof.

Sec. 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the non-performance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

Sec. 15. All Acts and parts of Acts inconsistent with the provisions of this Act, are hereby repealed; *provided*, that such repeal shall not affect proceedings commenced for the collection of assessments heretofore levied, but all such assessments may be collected in accordance with the provisions of the laws then in force.

Sec. 16. This Act shall take effect immediately.

A Menace toward England.—The fact has recently come to light that in one of his dispatches, last summer, Secretary Seward caused the English Government to be notified that if the Laird rams were permitted to escape and get into rebel hands, our Government would order their capture subsequently, even if found in British waters. He based this threat solely upon the ground that we had no other remedy, if England persisted in depriving us of our right to be protected against the illegal fitting out of war vessels against us in British ports. Palmerston took the hint, and the rams didn't escape.

Copies of the Mining and Scientific Press of January 28, 1865 (No. 4, of Vol. X), are wanted at this office, and for which we will pay full price.

THE NEWTON COPPER MINE.—One of the proprietors of this mine, in transmitting the amount of his subscription to the MINING AND SCIENTIFIC PRESS, says: "The water in our mine since the winter rains set in, has been so abundant as to occupy all our hoisting power to keep it out. Previous to this we were shipping about 100 tons per month of 19 per cent. ore. I am going to try and get you some subscribers here, for I do think your journal is truly worthy of a good support. Wishing you much success, I remain yours, &c., J. N."

KEEPING OUT OF THE COURTS.—The miners in Genesee Valley, Plumas County, have held several meetings for the adjustment of difficulties in regard to the ownership of claims, &c. It is their intention to have all disputes settled in that manner, so as to keep out of the courts.

A GREAT TRUTH.—Wendell Phillips said in a late lecture at Cooper Institute: "When the Court of St. James looks down into the poor man's cradle, it interferes in his behalf, if it interferes at all, from a motive of Christian principle. But when Wall street and State street and Chestnut street look down in to the poor man's cradle, they remember that the hand holds a ballot; they remember that, unless it shall be taught to wield its power with judgment, the nation will feel it in the future to its cost. And the wealth, the strength, the education of thirty millions of people are mortgaged to cover that cradle with the choicest influence of civilization."

A MAN applied to Dr. Jackson, the celebrated chemist of Boston, with a box of specimens. "Can you tell me what this is, Sir?" "Certainly I can, Sir; that is iron pyrites." "What, Sir?" in a voice of thunder. "Iron pyrites." "Iron pyrites! and what is that?" "That's what it is," said the chemist, putting a lot on the shovel over the hot coals, where it disappeared. "Dross." "And what is iron pyrites worth?" "Nothing." "Nothing! Why, there's a woman who owns a hill full of that in our town, and I've married her!"

A BIT OF TRUTH.—The Richmond *Dispatch* says that within six months after peace is restored in the United States, the armies of the Union will have delivered the Mexican people from the yoke of their oppressors, and their rich country will form a portion of the United States.

YOU can stop a clock at any moment, but you cannot stop a watch. The same remark brethren, applies to the stopping the talk of a man, and of a women. He is a great, coarse, ugly machine, but you can sileuce him. She is a beautiful, fragile, jewel led thing—but she will run on until she stops of herself.

THE latest illustrious Englishman who has visited our shores, has given it as his opinion that our youths are smoking themselves to death.

CORRECTION.—In common with others of our cotemporaries we have been in error in attributing to Mr. Fairbanks, the discovery of the new species of turpentine, to which we made lengthy reference two or three weeks since. The real discoverer is Mr. J. W. Jacobson, of Marysville, to whom was awarded the State premium bounty for producing the first thousand gallons of California turpentine. Mr. J. has no associate in the discovery, and is entitled to the fullest credit therefor. He was also the first to produce camphene in this State through the agency of steam. J. E. Marchand, at 517 Front street, in this city, is agent for the discoverer.

A LARGE MAGNET.—Among the philosophical apparatus belonging to the Free Academy in New York City, is an electro magnet weighing 650 pounds, which has held seven men suspended at one time, and how much more weight it would support nobody knows. This magnet was made by Charles T. & J. N. Chester, of 104 Centre street, in that city. It is formed of two round bars of the softest iron, each five inches in diameter and twenty-four inches in length, which are secured at one end by massive screws to a cross piece to form a U magnet. The bars are wound with 200 lbs of No. 13 copper wire, insulated with cotton and shellac, and laid on eight equal lengths, making the finished bar about eight inches in diameter. The armature is a bar of soft iron weighing eighty pounds. A neat wagon is employed for moving this magnet about the room, or it may be suspended from the ceiling by means of block and tackle.

ALLEGED VALUABLE RECIPE.—Mrs. Elizabeth P. Hall, who has raised a family of children, sends the Santa Rosa *Democrat*. for publication, the following, which she recommends as a sure remedy for croup: Take roll brimstone and pulverize it, put half a teaspoonful in the white of an egg; beat it until the froth will stand on the side of a plate; when the water runs out give that to the patient; give all that appears, and if this does not produce relief, immediately double the dose. The remedy is a sure one, and Mrs. Hall feels safe in recommending it to all mothers. If the patient is old enough, a piece of brimstone taken in the mouth masticated and swallowed, will produce the same result.

Machinery.

WM. BRUCKNER'S

Furnace for Roasting Ores,

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron Cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,

5v10 No. 416 Market Street, San Francisco.

IMPORTANT INVENTION.

Hunter's Concentrator, Amalgamator and Separator.

For the concentration of Gold, Silver and Copper ores, and separating all kinds of metals from the sands, where the specific gravity of the metal is greater than that of the rock, a machine is now on exhibition at No. 521 Market st., above First, at BACON & WEBSTER'S Quartz Grinding Works, where it will be running from two to three o'clock P. M., for the inspection of all interested in mining. The inventor is prepared to manufacture machines to supply all orders promptly. The sixth of a horse power is sufficient to run one of these machines. For the above machine a patent has been applied for. Orders for machines, or for circulars and further information, should be addressed to

ANDREW HUNTER, Inventor.

The following extracts from Reports are submitted to the public as giving the results of a fair working test of these machines:

BEAR VALLEY, DEC. 12, 1864.

MR. A. HUNTER—*Dear Sir:* I take pleasure in stating, in reply to your request, that your concentrator has now been running uninterruptedly, at Princeton Mill, for more than three weeks, and the enclosed notes, by the Superintendent Mr. Williams, of a carefully measured test of its performance during a period of a day and three-quarters, I believe fairly indicates what it has been doing through the whole of that time. First, the loss of the sulphurets, per cubic foot of tailings from the Concentrator, was about one-tenth of an ounce. Second, the loss of sulphurets from the blankets was nearly *fifteen times greater* than that from the Concentrator. The Concentrator has not been found at any time in the slightest manner out of order, and has required scarcely any attention. Congratulating you upon the these facts, I am, sir, very respectfully yours, FRED. LAW SEFEAD,

Manager Mariposa Company.

Notes of test run of Hunter's Concentrator—it having been supplied during the test with the sands reduced by one battery of the Princeton Mill, in the condition in which they are usually received by the blankets:—

Running time	1¾ days.
Amalgam saved on the plates of the Separator during above time, value	$6 75
Rate of saving of single machine per day	3 86
Rate of saving of six machines per day	22 16
Yield of Sulphurets, 1¾ days, pounds	215
Yield of Sulphurets, one days run of one Machine	123
Rate per day of saving from six machines, being the whole number required for the Princeton Mill	738
Yield of amalgam from plates of Separator, per ton of rock crushed, value	55
Yield of sulphurets from Separator per ton of rock crushed, pounds	18

HANNIBAL WILLIAMS,

Superintendent Princeton Mill.

SAN FRANCISCO, DEC. 18, 1864.

I have recently examined one of Hunter's Concentrators and Amalgamators, in operation at the Princeton Mill, Mariposa Estate, the sand and crushed rock, flowing from one battery of four stamps, passing directly over the machine, without using blankets. On examination, it shows conclusively that the loss of sulphurets by the machine is much less than by the blankets, being but a mere fraction of the sulphurets, consisting of the light and thin scales, such as can scarcely be saved by panning; while on the other hand the tailings from the blankets contain a large amount of heavy sulphurets. The product of the machine is almost pure, clean sulphurets—the copper plates of the machine, being amalgamated, securing much or all of the free gold that escapes the battery. I witnessed the cleaning up of the machine, and the collection of a ball of amalgam. From the weights taken we may state the constitution of this ore, as it came from the batteries at that time, as follows:

Clean Sulphurets containing free gold and amalgam	18.00
Quartz sand, waste	1981.78
Loss of Sulphurets and tailings	.22
Total	2000.00

WM. P. BLAKE,

Professor of Mineralogy, Geology and Mining, Mining and Agricultural College, California.

Hunter's Machine was illustrated in the Mining and Scientific Press of December 24th, 1864. 3v10

4v10

A Diminutive Breed of Cattle.—In the report of the Secretary of the Massachusetts State Board of Agriculture for 1862, Mr. Flint gives the following description of the cows of Brittany, a province in the north of France, as seen by him at the International Exhibition in London:

The little Bretagne cows pleased me exceedingly. Standing only about three feet high on their legs—the most fashionble hight—mostly black and white, now and then, but rarely, a red and white; they are as docile as kittens, and look pretty enough to be the kitchen pet of the hard pressed mountain farmer, with pastures too short for a grosser animal. Ten pounds of hay will suffice for their limited wants for twenty-four hours, and they would evidently fill a ten quart pail as quick and as long as any other cow.

Those pretty cows will often hold out in milk, so the herdsman said, from fifteen to eighteen months after calving, and often give six or seven quarts a day with their first calf. The horn is fine, not unlike the Jersey, but smaller and gradually tapering, and the escutcheon or milk-marks of Guenon generally good. Good cows are held at from sixty to seventy dollars a head—a fancy price, of course, but I am not sure that they would not pay six per cent. on the investment as well as most "fancy stock."

The new artesian well at Chicago is said to discharge a greater quantity of water than any other well in the world, throwing out 576,000 gallons per day, the clebrated well at Grenelle, near Paris, discharging only 500,000 gallons per day.

Register your Letters.—In remitting cash for subscriptions to the Mining and Scientific Press, our patrons will please register their letters, and we will then be responsible for their reception. Parties remitting without registering their letters will do so at their own risk. The fee for registry is twenty cents, for which a receipt is returned by the Postmaster to the sender from the party receiving the money.

HANSCOM'S CRUSHERS,
Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete: Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.
1 Golden State Iron Works, San Francisco.

Boot-Blacking Machine.
This late "YANKEE INVENTION" has arrived in California, and can now be seen
At the St. Lawrence Hotel, Market Street.
This machine is a great labor-saving invention, and will be found of especial value in large hotels, and for use at all boot-blacking stands, etc. The public are requested to call at the St. Lawrence Hotel and decide for themselves with reward to its merits, rather than to make up their minds as to its value from some peripatetic news-reporter, who may be a better judge of tangle leg whiskey than mechanical ingenuity. Rights to use this Machine for sale.
7v10 A. E. WHITE.

PRATER'S
PATENT CONCENTRATOR.
THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed
It Has No Equal in Use.
The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.
This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to
HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.
The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.
Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.
For further particulars, or to see this Pan in operation, call on or address J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

Hepburn & Peterson's
AMALGAMATOR.
THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the miucral from
Gold and Silver Ores,
Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.
These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, as liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.
☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.
(Illustrated in the Mining and Scientific Press, April 9th, 864.) HEPBURN & PETERSON.
nov8 3m*

NOTICE TO MINERS.
NEW QUARTZ MILL.
THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.
B. Fauchery and F. Genard
Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.
F. GENARD, Metallurgist. B. FAUCHERY, Engineer,
24v9

TO QUARTZ MINERS.
Hinkle's Centrifugal Pulverizer and Amalgamator!
THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.
This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.
Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.
The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to
PHILIP HINKLE,

ATWOOD'S
Self-Regulating Windmill.
This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at
222 Mission Street, North side, below Beale,
San Francisco.
N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.
222 Mission street, below Beale. 5

Pacific
BEATER PRESS
Company.
San Francisco, California.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other
HAY AND COTTON PRESSES.
This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay, in dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.
The fact that Beater Pressed hay commands a better price in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.
This press is equally efficient for Cotton, Wool, Pulu, Tow, Hemp, Hair, Manilla, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties intersted are invited to call and see one in operation.
Office and Warehouse—MISSION STREET, between Main and Beale streets.
W. H. MITCHELL,
2v10 General Agent.

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.
Prices, from $50 to $1,000.
ROUND AND SQUARE WATER TANKS BUILT TO ORDER.
HUNT'S PUMPS
Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.
HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.
ALSO, THE
Self-Regulating Horse Power
Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.
ALL WORK WARRANTED.
☞ For further Particulars see small circulars. ☜

FARRAND'S
Oscillating Amalgamator,
RECEIVED THE
ONLY PREMIUM
AWARDED FOR AMALGAMATORS
At the Recent Industrial Fair
OF THE
Mechanics' Institute of San Francisco.
Committee of Awards.
O. Belden, W. T. Garratt, H. P. Wakelee,
O. Goat, Geo. Johnson, C. M. Radcliff.
This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.
This Unrivaled Amalgamator possesses many advantages over all others now in use.
1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.
2d. It reduces the pulp finer, thereby producing a better result.
3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.
4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.
5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.
Manufactured at the MINERS' FOUNDRY.
W. D. FARRAND, Inventor,
R. L. OGDEN, Agent, SAN FRANCISCO.
S. E. corner Montgomery and California streets.
19v9

Disney's Cylinder Amalgamator,
The Cheapest and Best.
DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.
It may be seen in operation at the Rail Road Foundry on Fremont street where
A NEW CRUSHER
Is in operation and he can crush and Amalgamate at the lowest rates. Miners and all others interested are invited to call and examine for themselves.
M. DISNEY, Patentee.
San Francisco, June 23, 1864. 1-3m

VARNEY'S
PATENT AMALGAMATOR.
These Machines Stand Unrivaled.
For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Operates as Follows:
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill men are invited to examine these pans and setlers for themselves, at the PACIFIC FOUNDRY,
1v10 San Francisco.

THE NOVELTY.
This ROTARY CYLINDER GRINDER & AMALGAMATOR did not receive the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easily taken up, and, in fact, is a perfect machine.
In offering his Amalgamator to the mining public the Inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker in mining machinery, that there is room for improvement in that direction, and that he has, by careful study, invented his improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.
This invention consists of a cylindrical-shaped case placed horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller (one or more) placed within it, and covered with shoes one and a half inches thick, and so constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the German Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pulp in one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.
This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.
H. L. HOPKINS,
1v10 Inventor and Patentee.

DUNBAR'S
PATENT SELF-ADJUSTING
Piston-Packing.
Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.
IT WILL SAVE EACH SEASON MANY TIMES ITS COST in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.
Having obtained the Agency of this Valuable Improvement, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,
23v8 Golden State Iron Works, San Francisco.

HUNT'S NEW DITCHER.
HAVING SECURED FROM THE INVENTOR THE SOLE right to manufacture these Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.
With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to
E. O. HUNT,
Windmill Builder, No. 28 Second Street and 110 & 112 Jessie Street, San Francisco. 9v22tf

SALMON'S
PROPELLER AMALGAMATOR.
The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

	No.	Fine		No.	Fine
Assay	250	913	Assay	300	990
Assay	285	941	Assay for Czotman		980
Assay	286	940	Assay Water Rock		966
Assay	291	930	Assay Water Rock		998
Assay			St. Helena Ledge, W. D.		966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.
Manufactured at the San Francisco Foundry, San Francisco, California, by
J. & W. C. SALMON,
To whom all orders should be addressed. 15

And in accordance with law, and an order of the Board of Trustees, made on the 20th day of January, 1865, so many shares of each parcel of said stock as may be necessary, will be sold, at public auction, by Maurice Dore & Co., 327 Montgomery street, San Francisco, on the 11th day of March, 1865, at 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. M. BUFFINGTON, Secretary.

Office, Nos. 8 & 10 Government House, corner Washington and Sansome Streets, San Francisco, Cal. fe25

THE "Mining and Scientific Press" is an excellent journal, and ought to be subscribed for by every miner and artisan on the Pacific coast.—*Nevada Daily Gazette.*

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day are published as Serials, from week to week, in THE GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished talent in the Atlantic States and Europe; including "Orpheus C. Kerr," Fitz Hugh Ludlow, G. B. Densmore, "Mark Twain," Dan De Quille, Florence Fane, Miss Emma Hardinge, Sarah E. Carmichael, Annie E. Fitzgerald, "Occasia Owen," Alice Mason, William Simpson, Chas. F. Stoddart, "Ina," H. C. Williston, "Albion," "Fairfax," Bonnevel, Mary Kyle Dallas, Margaret Hosmer, and many other accomplished writers of Fiction, Romance, Novels and Stories, Poetry, Essays, Sketches, etc., etc., comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

Sent from the Office to any Address in California and Oregon—Nevada, Washington, Idaho, Utah and Colorado Territories—the Atlantic States, Europe, and all parts of the World.

Subscriptions to be Paid in Advance.

ONE YEAR $4. SIX MONTHS $2. THREE MONTHS $1.

Take care to write distinctly the name of the person; the name of the city, town or locality where the Post office is situated, and the name of the County and State, in order that the paper may be fully and accurately directed to every address.

THE GOLDEN ERA TO CLUBS.

Parties (living remote from localities where agents are located) forming a club of five yearly or half-yearly subscribers, and forwarding the subscriptions (by letter registered and postage paid) to the office of publication in San Francisco, will be entitled to an additional copy of The GOLDEN ERA for the term of one year, or to retain the equivalent in cash.

AGENTS in every part of the State receive subscribtions for the GOLDEN ERA.

POSTMASTERS in California, Oregon, and neighboring Territories, obtaining subscriptions for the GOLDEN ERA and forwarding the same, with name and address of the subscriber, will be allowed a commission therefor.

PARTIES residing in localities where no Agents are established will forward their subscriptions by mail.

SUBSCRIBERS will be careful in writing as plainly and fully as possible, the direction of papers to be sent to any part of California, the Atlantic States, or elsewhere.

Now is the Time to Subscribe.

TO ADVERTISERS!

Best Advertising Medium—The "Golden Era" is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village, and mining and agricultural precinct in California, and offers unusual and unequaled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

GOLDEN ERA POSTAGE.

POSTAGE on the GOLDEN ERA, to Mail Subscribers, in California and throughout all the States and Territories of the Union, per quarter, (3 months).... 5 cts. To be paid quarterly, in advance, either at the Office of Mailing or Delivery.
POSTAGE on the GOLDEN ERA, Single Copies, transient, to be prepaid by stamps..... 2 cts.
POSTAGE on the GOLDEN ERA, to Mail Subscribers in the county (San Francisco) where published..... Free.

TO MAIL SUBSCRIBERS.

The Golden Era, for One Year..... $4 00
The Golden Era, for Six Months..... $2 00
The Golden Era, for Three Months..... $1 00

Subscriptions to be Paid in Advance.

BROOKS & LAWRENCE,

GOLDEN ERA BUILDING,

543 Clay st., near Montgomery, San Francisco.

LET there be plenty of sunlight in your house. Don't be afraid of it. God floods the world with light, and it costs you an effort to keep it out. You want it as much as plants, which grow sickly without it. It is necessary to the health, spirits, good nature and happy influence. Let the sunlight stream freely in.

THE cotton lords of England are sorely vexed at the capture of the 33,000 bales of cotton by Sherman at Savannah. As it pleases the American people, these lords must rest contented.

"PETER'S PENCE, at Rome," produces less and less. At the commencement the product was about 4,000 Roman crowns a month. It afterward fell to 2,000, and goes on decreasing. November gave only 700.

WELL BESTOWED.—Colonel Hardy, who recently sold his interest in a copper mine at Copperopolis for $650,000, immediately donated $5,000 to the Sanitary Fund.

THE attempt to grow oranges and lemons in California is every year becoming more and more successful. This year nearly 100,000 oranges, and about 40,000 lemons have been raised in this State.

Memorandum for Secretaries.

Safe Rules for Advertising.

Make your order levying the assessment on any day EXCEPT FRIDAY, and advertise the Assessment Notice on the FIRST FOUR succeeding SATURDAYS, setting the day for delinquent advertising on the FIFTH SATURDAY, and the day of sale on the SEVENTH SATURDAY, or any day thereafter, PREVIOUS to the EIGHTH SATURDAY.

ADVERTISING IN THE INTERIOR.—If the mine or works of the corporation are located in any State or Territory of the United States, notice must be advertised there also, if a newspaper is published in the same county. On this account, SATURDAY is the best day on which to levy assessments, as thereby the longest period possible is gained for transmitting a copy to interior papers, which are usually published on Saturdays.

POSTPONEMENTS.—The date set for advertising delinquent stock, and the day of sale mentioned in either notice, may be *once* postponed for any period not to exceed ten days. Secretaries can avail themselves of this privilege when assessments are levied on Friday and they are obliged to advertise at the mine on Saturday, or desire to publish on that day at the place of incorporation.

ERRORS, OMISSIONS, OR DELAYS are definitely provided for in Section 14 of the new law, whereby it is plain that, if the advertising is delayed, the Secretary can only fix the dates for delinquent advertising and sale to suit the time he is to advertise, and proceed anew.

WHEN PAYABLE.—It is the usual custom to make the assessment "payable immediately," or upon some date within a day or two from the time of levying the assessment, although the law makes no requisition as to this matter.

BLANKS FURNISHED FREE to advertisers in the MINING AND SCIENTIFIC PRESS, for Assessment Notices, Delinquent Sales, Postponements, etc.; also copies of the Assessment Law of 1864. Copies of advertisements, for sending personal notice to shareholders, printed at $1 per hundred.

The PRESS is the most ECONOMICAL advertiser for stockholders, reliable and obliging for Trustees and Secretaries, and merits the patronage of the mining interests.

Correct blank forms for advertising, and any information desired by advertisers, will be furnished, gratuitously, at the office of the MINING AND SCIENTIFIC PRESS.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Mining Notices—Continued.

Alta Coal Mining Company, Clayton District,
Contra Costa county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 13th day of February, 1865, an assessment of fifteen cents per share was levied upon the Assessable Stock of said Company, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 1st day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. MARTINON, Secretary.
Office, 811 Montgomery street, up stairs, San Francisco.

*Assigned, but not transferred.

And in accordance with law, and an order of the Board of Trustees, made on the 9th day of January, 1865, so many shares of each parcel of said stock as may be necessary will be sold at public auction at the salesroom of Messrs. Cobb & Sinton, No. 406 Montgomery street, San Francisco, California, on the 27th day of February, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

S. C. GARDNER, Secretary.
Office, at Bemis & Edson's, (who are authorized to receive and receipt for assessments due as above) No. 16 Drum st., between California and Sacramento streets, San Francisco. feb11-6

POSTPONEMENT.—The above sale is hereby postponed until Monday, March 6th, 1865, at the same place and hour. By order of the Board of Trustees.

7v10 S. C. GARDNER, Secretary.

SCIENTIFIC AND MINING JOURNAL.—This is as valuable a publication as is produced on the Pacific Coast, and one which interests all parties. It contains much that is instructive and entertaining, and seems to have the right men at the head of its affairs.—*Spirit of the Times.*

Kenkuk Gold, Silver and Copper Mining Company. Clayton Mining District, Contra Costa county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 16th day of February, 1865, an assessment of 7½ cents per share was levied upon the capital stock of said Company, payable on the 18th day of February, 1865, in United States gold coin, to the Secretary, at his office, No. 224 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 3d day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. B. WINEGAR, Secretary.

Office, 224 Clay street, San Francisco. 7v10

La Paz Town Association, La Paz, Arizona Territory.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 17th day of January, 1865, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
J H Titcomb	7	25	$12 50
J H Titcomb	8	25	12 50
J H Titcomb	9	50	25 00

J B Frisbie	25	100	50 00
J B Frisbie	not issued	200	100 00
Wm Harwood	not issued	100	50 00
Wilbur Curtiss	not issued	200	100 00
P B nding	not issued	200	100 00

And in accordance with law, and an order of the Board of Trustees, made on the 17th day of January, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, at the Company's office, 328 Clay street, San Francisco, California, on the 7th day of March, 1865, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

B. W. MUDGE, Secretary.

Office, No. 328 Clay street, San Francisco, Cal. 7

La Libertad Gold and Silver Mining Company, Cacachilla District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 28th day of January, 1865, an assessment of thirty-five cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 4th day of March, 1865, will be advertised on that day as delinquent, and unless payment be made before, will be sold on Saturday, the 18th day of March, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WILLIAM YALE, Secretary.

Office, No. 36 Exchange Building, N. W. corner of Montgomery and Washington streets, San Francisco.

feb4-5-4

Mammoth Gold and Silver Mining Company, Silver Mountain District, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 12th day of December, 1864, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, or to H. D. Scott, Superintendent, at Silver Mountain.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 1st day of April, 1865, to pay the delinquent assessment, together with costs of Advertising and expenses of the Sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

Office, No. 430 Montgomery street (Room No. 5, up stairs), San Francisco.

Notice.—On account of errors in previous proceedings, the above assessment notice is published anew, and stockholders who have paid on the previous notice will be credited accordingly.

7v10 J. WARREN CLARK, Secretary.

Morning Star Gold and Silver Mining Company, Echo District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of December, 1864, an assessment of one dollar and twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to J. W. Shanklin, Secretary and Treasurer, at the office of the Company, No. 625 Merchant street, U. S. Land Office Building, San Francisco.

This assessment is made subject to such credit for the stockholders as may have been allowed them on any payments of assessments, or expenses of incorporation, and the filing of the necessary vouchers on the same.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 1st day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. W. SHANKLIN, Secretary.

Office, No. 625 Merchant street, San Francisco. 3-4

Mining Press.—The San Francisco *Mining Press* has entered upon its tenth volume, and bears evidence of increasing prosperity. Oewey & Co. have, by untiring industry, made the *Press* one of the leading papers of the State, and as a mining journal it has no superior in the country. Those interested in the mines on this coast can make no better investment of five dollars than by subscribing to this excellent journal.—*Alpine (Markleeville) Chronicle.*

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the Mining and Scientific Press. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

Mining and Scientific Press.—This well conducted journal has entered upon its ninth volume. It is a sterling periodical, and deserves encouragement.—*Territorial Enterprise.*

Mount Davidson Gold and Silver Mining Company, Virginia District, Storey county, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 11th day of January, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

GEO. R. SPINNEY, Secretary.
Office, No. 240 Montgomery street.
San Francisco, Feb. 13, 1865. 7-4t

New Year Diggings Gold and Silver Quartz Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 3d day of February, 1865, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, which assessment has been levied to liquidate the debt of the company.

Any stock upon which said assesment shall remain unpaid on Saturday, the 11th day of March, 1865, will be advertised as delinquent, and unless payment shall be made before will be sold on Saturday, the 25th day of March, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

AUG. KUNAST, Secretary.

Office, No. 540 Washington street, San Francisco.

feb4-5-4

Ontario and Webster Gold and Silver Mining Company, Montgomery District, Mono county.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 16th day of February, 1865, an assessment of fifty cents per share was levied upon the capital stock of said company, payable on the 20th day of March, 1865, in United States gold and silver coin, to the Secretary, at his office, No. 571 Mission street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 3d day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. B. SHELDON, Secretary.

Office, No. 571 Mission street, San Francisco.

N. B.—This assessment includes one of 25 cents per share, levied on the 26th day of May last, and all stockholders who have paid that assessment will be credited the amount of such payment on the presentation of the receipts for the same. [7] H. B. SHELDON, Secretary.

Oroville Gold, Silver and Copper Mining Company, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of January, 1865, an assessment of five (55) dollars per share was levied upon the capital stock of said Company, payable on the 1st day March, 1865, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 810 Montgomery street, San Francisco, California.

Any stock upon which said Assessment shall remain unpaid on Saturday the 4th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday the 18th day of March 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

ROBERT P. LEE, Secretary.

Office, No. 810 Montgomery street. feb4-5-4

Porter Gold and Silver Mining Company, Jordan Hill, Butte County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 11th day of June, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the 11th day of June, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the salesroom of Edwards, Olney & Co., No. 626 Montgomery street, San Francisco, California, on Saturday the 25th day of February, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

THOS. C. McCALLAN, Secretary.

Office, No. 622 Clay street, San Francisco. feb14

Providence Gold and Silver Mining Company, Works in Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 1st day of February, 1865, an assessment of two dollars per share was levied upon the capital stock of said Company, payable on the 24 day of February, 1865, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment, shall remain unpaid on Saturday, the 4th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 18th day of March, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, Nos. 7 & 10 Government House, corner Washington and Simsome streets, San Francisco. feb4-5-4

Drs. Whitcomb & Dyer,

DENTISTS,

[Successors to W. H. Irwin.]

No. 205 Third Street, near Howard,

18-v9 SAN FRANCISCO.

IN THE DISTRICT COURT OF THE FIFTEENTH JUDICIAL District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

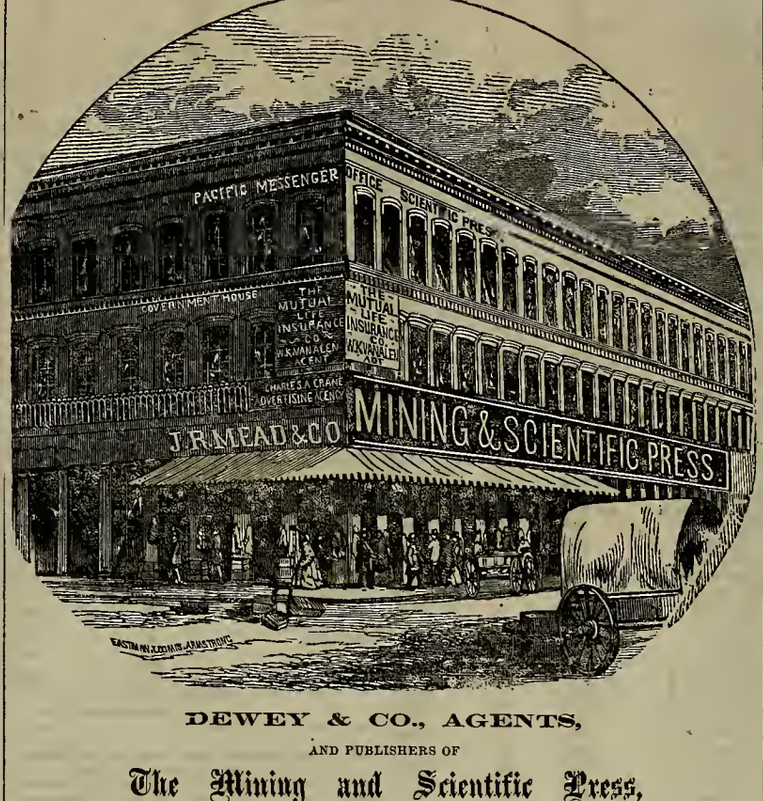
The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk.

By G. C. LETCHER, Deputy Clerk.



C. Sims, Attorney for Plaintiff. 7v10-3m

"A WORD TO THE WISE," ETC.—Parties in the Eastern States who desire positive information concerning the mineral wealth and developments of the Pacific States, should look for the same in some journal, published on this coast, sufficiently truthful to enjoy a permanent circulation in the communities represented. Those credulous enough to patronize the mushroom bantlings of defunct California Jeremy Diddlers may expect to get "bilked."

TO MINE OWNERS.

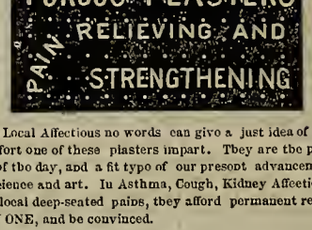
REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address **J. MOSHEIMER,**



No. 338 Montgomery street, Corner of California street, San Francisco. 23v9tfq

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Principal office, Brandreth Building, New York.

W. F. BRANDRETH.

10v2tf Office at Crane & Brigham's San Fran.

In Local Affections no words can give a just idea of the comfort one of these plasters impart. They are the plaster of the day, and a fit type of our present advancement in science and art. In Asthma, Cough, Kidney Affections, and local deep-seated pains, they afford permanent relief. TRY ONE, and be convinced.

Metallurgy of Copper in California.

[By Paul D'Hericy, M. D., Mining Engineer, Professor of Chemistry and Metallurgy, Superintendent of the Copper Mining and Smelting Company, Queen of Bronze, Oregon.]

NUMBER SIX.

SECOND OPERATION—SMELTING FOR MATT.

Matt is what is generally called regulus. It is composed about of

Copper	.35
Iron	.31
Sulphur	.32

and some other foreign matters in small quantities. If it is richer in copper than thirty-five and thirty-six per cent. the scoria contains too much copper, and should be subjected to a second smelting.

There is subject to this smelting:

1st. The calcined ores.

2d. Ores which are sulphurous and not pyritous, and which are rich and free from antimony and arsenic.

3d. Scoria of the same smelting, if it contains oxyd of copper.

6th. Rich scoria, produced by the purifying, if, by accident, they contain arsenic and antimony.

5th. The debris of the furnace and crucibles, etc., containing copper.

6th. The fluxes necessary to form silicates with the oxyd of iron, and earthy veinstones.

These substances are arranged in layers, on the ground, near the furnaces, and divided by the portion which is called the charge. Below is a sample of the charge:

	POUNDS
Calcined Ore	2,000
Sulphurous Ores, without Pyrites	70
Debris of the Furnaces, Crucibles, etc	100
Different scoria containing Copper	660
Lime, or Calcereous substances	200
	3,030

We have added lime in order to make the scoria more fluent. We seek to maintain the uniformity of the charge as long as the ores are the same. We succeed well in this by varying the quantity of fuel according as the furnace becomes too warm or too cold.

The condition of the mixture of a charge is such as to form a neutral silicate of the protoxyd of iron, to scorify the earthy alcalis, and to leave the copper free, under the form of a sulphuret. Consequently, if the quartz is not sufficiently abundant, it is requisite to add it; if, on the contrary, it is too abundant, and the scoria are too pasty, it is requisite to add lime. A good smelter soon finds the proper proportions.

A season lasts about fifteen days. We call a season the space of time during which a furnace remains in fire. After about fifteen days, the refractory bricks which line the furnace, and the brasque of the crucibles, are unfit for service. Then we allow the fire to go out slowly, and everything is repaired. After which, we allow it to dry in the air during some days. We then bent it little by little with the charcoal, which is added frequently in small portions. When the lower part is red hot, we fill with charcoal, and give a little wind.

After twelve or fifteen hours the furnace should be at the suitable temperature. We fill, then, with scoria, against the back wall, and we seek to produce the *nose* as fast as the smelted scoria come before the tuyere.

Below is what is the *nose*.

The wind should come to the center of the furnace, where the combustion should be carried to the highest degree of intensity. It would be requisite then that the tuyere be extended, for this effect, some inches into the furnace; but no substances resist the heat and the reaction which they would there undergo. In consequence we make use of means which is presented naturally. A nozzle of scoria is formed, like a prolonging of the tuyere, by means of the pressure of wind, which opens for itself a passage across the matters in fusion, and of its low temperature, which coagulates the sides of this artificial nozzle.

According to the nose which is formed, we judge of the proportion of fuel to be used. If the nose is too short, the temperature is too high; if the nose is too long, the temperature is too low, and we add or diminish the charcoal according to these circumstances. The most difficult part of this operation is the maintenance of the nose to the proper length. When it is in a good condition, the operation goes on regularly. Its length ought to be kept between four and six inches.

This nose being well formed, we throw a certain quantity of the charge against the back wall, the charcoal against the fore wall and we augment progressively the quantity of wind, until we have obtained the normal temperature, which takes place, ordinarily, at the end of three days. We modify the quantity of wind according to the facility with which the scoria flows. The proportions of fuel vary also, according to the temperature. The regular charges will be about in the proportion of 200 of the charge, for thirty of charcoal in weight. When we wish to make a charge in these proportions, it is on the charcoal that it bears.

The charge is made by the opening contrived above the fore wall. The workman mounts on the platform of the fore crucible, which is covered with a sheet of iron, he carries on his head a basket of charcoal, or of charge, and throws the contents into the furnace, in such a manner that the two different substances are sufficiently well separated; the ore always against the back wall, and the fuel against the fore wall. The moment when it becomes necessary to charge is indicated by the sinking of the substances, and by the vivacity of the combustion of gas at the mouth.

We must have care to shut the opening of the fore crucible, before the fore wall, by plasters of scoria and of small charcoal.

The substances should be maintained in perfect fusion, in order that they may be separated in the crucible according to their specific gravity. From the time the substances are enough elevated in the crucible, the scoria commence to filtrate through the charcoal and flows by a little canal, which has been contrived for them, upon the platform of the fore-crucible we leave them to spread themselves freely on the floor of the smelting house. The runs of metal are made at very close intervals; three or four times by post, according to the number of charges made. We ought always to make the running before the metal in fusion in the crucible reaches the lower part of the fore wall.

The exterior basin, in brasque, where we should receive the running, ought to be dried and beated with hot scoria. There is frequently need of repairs. In order to work the running, the workman dips his bar of iron in the tap hole which traverses the brasque and finishes at the bottom of the crucible, and pierces the clay plug which stops the canal. The matt, and afterwards the scoria, which float, run into the exterior basin.

We stop the wind only at the end of the running, at the moment when the scoria com-

mence to appear. The crucible being empty, the smelter stops, with a clay plug fixed at the end of a handle of wood, the orifice of the running. When this orifice is obstructed, and becomes too narrow, it is necessary to clean it with a rod of iron before re-stopping it, and even during the running.

The smelter raises immediately the scoria which close the fore crucible, verifies the condition of the crucible and cleans it if it is necessary, then he shuts again the fore crucible with plasters of scoria and small charcoal, as it has been said above. The wind is given and the operation continues.

All the work should be executed with the greatest rapidity, because the wind cannot be interrupted but during a very short time. The wind alone can prevent the deterioration of the nose, and when this is obstructed or partially melted, it is very difficult to restore it to a good condition.

After each running, we wait until the scoria is solidified in the basin in order to take it away all in one piece. The disk obtained always contains granulations of matt; it is broken, and it enters into the charge of the fourth operation. The matt is then taken off by disks of an inch to an inch and a half in thickness; it is broken and carried to the shut kilns for calcination. We avoid the too small pieces, which should not be less than an inch and more than four inches. If the matt was too compact, it is made more porous in making it run on the floor in small layers after the taking away of the scoria, or in cooling it suddenly with water.

Those who wish to ship matts to San Francisco should run them into moulds, in place of taking them away in disks. It is useless to draw attention to the fact that, in this case, it is requisite to leave them as compact as possible, in order to avoid that they be not pulverized in their carriage. We will obtain generally this compactness in running it into hot moulds and allowing a slow cooling.

The Problem of Gold and Silver Extraction—A General Review—No. IV.

BY PROF. L. LANSZWEERT.

The mercury used in amalgamating cannot be too frequently examined. I am sorry to say that a proportion of the mercury sold at the mines is impure or adulterated, and a very small portion of foreign metals impairs its fluidity and prevents amalgamation with the gold, while it is difficult for the inexperienced to detect the cause. Analysis has detected lead, tin, nickle, arsenic, zinc and many other foreign substances; and nothing but absolutely pure mercury is fit for amalgamation.

Whenever new mercury is purchased it should, before using, be purified by any of the following processes, and during use should be frequently examined, and if necessary, purified. The presence of foreign metals, alloyed with the gold in a large per centage, as is the case in quartz from most of the lodes, will occasion loss, and much embarrassment in amalgamating, and it is, in my opinion, one of the most formidable difficulties the mill-owner will have to contend with. Negligent or careless lubrication of the stamps or cross rods frequently introduces oil or other greasy matter in the mercury, and in such case hot water, with strong alkali dissolved in it, should be allowed to pass through the amalgamators. The following are several methods of purifying the mercury:—

1st. By distilling it in a retort with one-half its weight of iron turnings or filings.

2d. By digesting it with nitric acid, diluted with twice its volume of water, in a glass or stone vessel, at a temperature of 140 Fahr., twenty-four hours, stirring it from time to time, and afterwards washing it with clean water.

3d. By agitating it with a solution in water of corrosive sublimate or of sesqui chloride of iron.

According Ulex. rub two pounds of mercury for ten minutes with half an ounce of a solution of perchloride of iron (sp. gr. 1.48) and half an ounce of water. Then wash the iron solution off with clean water. If it contains more than one per cent. of lead, the operation should be repeated. By this process, when other metals are present in the mercury, they are more readily chlorinized than the mercury, and either washed away in the solution, or left as an insoluble powder.

For free gold the amalgamating machinery should be so constructed as to retain the pulverized ore as long as possible in contact with the mercury. It is at all times assisted by the application of heat, and especially in the winter. This can be done either by direct steam, or by means of the waste steam applied in the various ways that may be suggested, care being taken that the water is not greasy. The use of amalgamated copper plates is becoming more prevalent, as it serves the purpose of extending the mercury over a much larger amalgamating surface than can otherwise be done.

The first application of this process was made in California as early as 1853, at Douglas Camp, in Calaveras county, by Ness Worn, who, instead of copper plates, used brass plates, which did not answer his expectation. It was only during the ensuing year that amalgamated copper plates were practically and successfully applied in a quartz mill at Angels Camp, by James Brodie, one of our pioneer foundrymen, and the inventor of various appliances for the reduction of ores. In order to obtain a bright amalgam surface on copper it is necessary that the same should be free from any rust or oxyd, and that every trace of acid used to clean said surface should be neutralized by washing said plates in some alkaline solution, potash or soda, before the application of mercury. By the application of the following solution clean copper plates can be readily amalgamated:—

Take water, eight ounces; sulphate of ammonia, six drachms; nitrate of mercury, half an ounce.

Nearly all the auriferous quartz veins contain iron pyrites, which, by decomposition near the surface, have discolored the rock to a red hue, whence its term "blossom rock." Thus the veins are easily traced, even by the inexperienced. It is the very large proportion of iron pyrites and also of other sulphurets that has conferred upon the auriferous quartz its very peculiar and distinctive qualities. In quartz of some parts in California most of the iron is oxydized, and even does not appear in such large quantities. To the decomposition of the pyrites is due that peculiar structure in the quartz, coloring it red, as before stated, and making it cellular and of a spongy texture. In many instances the miners call it "*honey combed*" or "*burnt*," wrongly supposing its peculiar appearance due to igneous action. This cellular quartz is easily crushed, and when containing gold, to any amount, is the most profitable kind to work; as the decomposition of the pyrites has released the gold and prevents loss of mercury. As we penetrate into the veins and get below the action of atmospheric influences, we find the signs of decomposition diminished, and the pyrites appear in crystals of various sizes, and the quantity of gold in the quartz sometimes also increases. The very interesting problem is therefore presented of how the oxydation of the sulphurets is to be secured thoroughly and rapidly; since, unless this is solved, the old method of mining and exposing quartz to atmospheric influences before grinding and amalgamating must be resorted to, and that is a slow, tedious and *old fogy* process.

[To be Continued.

A River in the Pacific Ocean.—"It was left to Lieutenant Bent. of the United States navy, an officer of much scientific merit, and who was attached to the expedition to Japan under Commodor Mathew C. Perry, to discover a *river* in the ocean—of the Pacific—flowing northward and eastward along the coast of Asia, corresponding in every essential point with the Gulf stream of the Atlantic, and impinging in the northwest coast of America—imparting its southern influence to the coast of Oregon and California, to that degree, that the Winters are so mild in Puget Sound, in latitude forty-eight degrees north, that snow rarely falls there, and the inhabitants are never enabled to fill their ice-houses for the Summer; and, *per contra*, the vessels trading to Petropaulovski, on the coast of Kamsebatka, when becoming unwieldy from accumulation of ice on their hulls and rigging, run over to a higher latitude on the American coast, and thaw out in the same manner that sailing vessels, frozen on the Atlantic coast of America, retreat to the Gulf stream, until favored by an easterly wind. The fountain of the great Pacific "river in the ocean," from which this stream springs, is the great equatorial current of the Pacific, which in magnitude is in proportion to the vast extent of that ocean, when compared with the Atlantic. It extends from the tropic of Cancer on the north, to Capricorn on the south, and has a width of near three thousand miles; and with a velocity of from twenty to sixty miles per day, it sweeps to the westward in uninterrupted grandeur, around three-eighths of the circumference of the globe! until diverted by the continent of Asia, and split into innumerable streams by the Polynesian Islands."

To Start a Balky Horse.—Fill his mouth with dirt or gravel from the road and he will go. Now, don't laugh at this, but try it. The plain philosophy of the thing is—it gives him something else to think of. We have seen it tried a hundred times, and it has never failed.

Report of the Santa Cruz Petroleum Oil Works Company.

To the Board of Trustees of the Santa Cruz Petroleum Oil Works Company.

Gentlemen:—In accordance with your instructions, I started from San Francisco for the Oil Works at Santa Cruz on February 14th, and arrived there February 15th, at 5 o'clock P. M. Although my arrival was unlooked for that day, I found the works in full operation. The drill was making 38 strokes per minute. The depth of the well was 74 feet 4 inches from the surface. I cannot but compliment Mr. Sevenoakes, the contractor, upon the smoothness and accuracy with which the system of machinery by which the drill is worked, performs its functions. A pump is attached to the walking beam of the machinery, by which the cribbed portion of the well is kept clear of water, and which also supplies the boiler of the engine. A windlass connected by a drum and belt with the engine, serves to move the pump apparatus with which the well is emptied of the sand or gravel loosened by the drill. The drill, weighing about 600 pounds, attached to a heavy rope and supported by the usual derrick, is moved by a crank and walking beam connected with the engine. This machinery rests upon a heavy frame work of timber, settled deep in the earth, and locked together with strong iron bars.

The inclemency of the weather, and the position of the well, directly in the water current of the valley; the remoteness of the locality from the supply of materials, and the variety of works to be organized, are, in my opinion, sufficient reasons to account for the apparent slow progress of the well during the past three months of winter weather. Be that as it may, I am happy to state that *now* the machinery is in perfect running order, and gives good testimony that the contractor is competent to the task he has undertaken.

After a lapse of 22 hours, I again took the depth of the well, and found 75 feet 6 inches, giving 1 foot 2 inches of progress; but heavy rains had fallen in the night to prevent work, and new tubing had been let into the well.

In obtaining these measures, it was pleasing to witness the smoothness and accuracy with which the various parts in the system of machinery, as alternately brought into requisition, acted, and combined to the general result of perforating the rock and emptying the well.

Your contractor expresses, without reserve, his firm conviction that oil will be reached inside of 250 feet depth; and though he is consuming time without salary, is determined to persevere in obtaining perfect success. There was a momentary indecision in the conduct of the contractor which gave rise to the present visit of your Committee, but he has now reiterated his determination to faithfully fulfil his contract, and, if possible, make our enterprise the *first* in California to produce an oil-yielding well.

The situation of the little valley in which the well is placed, is about north and south, or about 5 degrees west of north.

The dip of the strata of the western range is towards the ocean, or from east to west. The dip of the strata of the eastern ridge is eastward, or from west to east—hence the antielinal line of the strata lies in the valley between the hills. This valley, being very narrow, might give the idea that the ridge between the strata on either side had fallen in, after an upheaval, by which the general continuous stratification had been elevated, for the stratum of petroleum in both the eastern and western ridge, from 4 to 4½ feet thick, although now dipping in contrary directions in the two hills, has evidently or apparently, once been continuous.

The dip of these strata is not rapid. Light sandstone lies above and below the petroleum stratum; in some places the sandstone is replaced by clean white sand, and which, though beneath the stratum of petroleum, is perfectly free from that substance. The top of the ridges are flat, with large oaks and pines growing thereon; is coated in some places with a thin stratum of petroleum—on the very summit several inches thick—separated by a bed of sandstone, several feet thick, from the subjacent 4 feet thick stratum of petroleum. In one spot, in particular, the roots of a large oak are buried and invested in the petroleum mass, apparently without injury to its growth. The petroleum itself is only bitumen or tar impaceled, or hardened by evaporation, in loose sand, from which it may be easily and quickly separated by washing it freely with ether, leaving the sand loose and clean as that on the sea shore. The heat of the sun softens it, when it flows in a thick, sluggish mass over the rocks. In the middle of the valley, or directly on the anticlinal line I have spoken of, the well is sunk. The elevation of the side hills at the well is about 150 or 200 feet.

At the depth of 75 feet 6 inches, the drill is perforating a compact clay colored sandstone, which, when triturated with the drill, appears like sea sand, and when observed with the magnifying glass, is found to consist chiefly of particles of transparent crystalline quartz; but just before arriving at this stone, the drill has passed through a bed of coarse round gravel stones and angular fragments—these are sandstone, pebbles and quartz. I observed one fragment of gypsum or crystallized calcspar. The gravel stones formed, doubtless, the bed of a rivulet, once at the surface, and through which, perhaps, the water now percolates, and indicates that the well is arrived to nearly the depth of the valley. Time did not permit me to visit the limestone deposits, about three miles off, where the lime-kilns of Davis & Jordan are situated, to form an idea of their bearing upon our locality, but if limestone is the requisite previous to the oil stratum, we have the prospect of being not far from it.

From the indications thus hastily collected, it would seem fair to infer, although certainly more corroborating evidence would be desirable, that the region in question had been ruptured, perhaps, at several different periods, by volcanic power, with free eruption of lava of a bituminous character. At a subsequent period, water, with its consequent depositions of sand, seems to have effected, during a very long epoch, a general overflow of the country—for the hills, reaching even to the highest ridge between Santa Clara and Santa Cruz, and most especially those of Scott's Valley, with the flat summits, and ridged with the horizontal lines of sand deposits, clean and fine as those of the sea coast, some bare of trees and others covered with oaks and redwood pines, fully justify this conclusion. Through fissures in these sand rocks, more or less compacted by pressure and argillaceous cements, the subjacent oil finds its pathway to the surface. Whether or not it should necessarily be covered in by an impenetrable strutum of limestone, which must be pierced to give it exit, time must decide. The appearance, however, of large quantities at a much higher elevation than our well at Lexington, on the Santa Clara side of the mountain range dividing the two counties, unquestionably proves that vast deposits of this hydro-carbon exist at no great depth beneath the deposits which resulted from the overflow of water. If the theory—not yet proved to be true—that these oils result from the action of salt water (sol. of mur. of soda) upon carbonate of lime, be correct, then it may be that while salt water overflowed the land, it percolated through subjacent lime rock, and gave origin to oil pools or rivulets beneath it, which now find their way to the sea, or force their way through crevices, syphon-like, to the surface. To establish this theory, however, more facts are necessary. That the oil which is now found on the surface of water pools, in the springs, and saturating vast beds of marl, as at Lexington, is not the filtration from the petroleum beds in the hills, appears to be proved by the fact that those beds are in as sharp and distinct strata as the over and underlying strata of sand-stone: that they do not appear to shrink nor loose their richness by loss of oil filtered from them; and more especially by the fact that beds of the most perfectly clean sea sand, not containing a trace of oil, are in the closest apposition and directly beneath them. Hence, it would seem fair to suppose that the present strata of petroleum are now entirely independent of their original source, but that the original source still continues to throw up, through fissures and crevices, such oil and condensable oil vapor as can penetrate the overlying strata.

I thus give a rapid survey of the location of your oil works and the state of the machinery employed, but would certainly recommend the subject as eminently worthy of a more extended investigation, when fairer weather will admit of easier locomotion over the endless succession of hills which extend between the ocean and mountain ridge separating the counties of Santa Clara and Santa Cruz. Respectfully submitted,

ARTHUR B. STOUT, M. D.

Read before the Board of Trustees, approved, and ordered printed. W. Fell, Sec'y.

San Francisco, Feb. 22, 1865.

The Nobs of Great Britain.—The British House of Peers at present consists of 1 prince, 2 royal dukes, 3 archbishops, 24 dukes, 31 marquises, 158 earls, 38 viscounts, 28 bishops and 158 barons. As the bishop of Bath and Wells sits, as also Bishop Aukland, the total number of peers is 435. There are also 19 peers who are minors, and 13 peeresses in their own right. There are 115 peers of Scotland and Ireland, (of whom 4 are minors,) who are not peers of Parliament. There are 210 members of the Privy Council, and the archbishops, bishops, colonial bishops, bishops of the Scotch Episcopal Church, and retired bishops number 95. There are 852 baronets, 451 civil and military knights, 103 noblemen and baronets who are knights of the various orders, 731 Companions of the Bath, 5 field marshals. 559 generals in the army, 385 generals in her Majesty's Indian army, 324 admirals in the navy, 54 judges in the United Kingdom and Ireland, and 159 Queen's counsel and sergeants at law.

Mechanical.

[Written for the Mining and Scientific Press.]

Our Light Draft Iron Clads.

[The following letter from an attentive New York Correspondent has been necessarily delayed for several weeks, as will be observed from its date.]

The Honorable Secretary of the Navy's report has the following item about our light draft iron-clads: "It was ascertained, however, when the first two approached completion, that their draft of water was more than was intended, the heavy armor and the two eleven-inch guns, with the machinery to give them proper speed, involved the necessity of enlarging the capacity of each of them," etc.

This paragraph contains, in mild terms, an acknowledgement, that the engineer intrusted with the designing and arranging of all details of these ships was not capable of executing so important a task. [He has been removed since, and his position assigned to a man whose whole professional life gives abundance of evidence of his ability.] Whatever induced the Department to give this important office to a man whose only claim to public notice consisted in the fact that he was first engineer of the Monitor at the time of her remarkable battle in Hampton Roads. The result goes to prove that if a merely practical engineer may sometimes copy with success a work already executed, he will never be able to produce anything partly or wholly original. He only who combines good practical experience with a thorough scientific or theoretical education (it does not matter whether self or in proper schools acquired) is capable of doing work creditably, in the execution of which he is partly, if not wholly, thrown on the resources which his own store of science, the cultivated taste of his mind and a thorough knowledge of the mechanical laws of nature only can offer him. A man calling himself an engineer and not possessing this part of an engineer's education, is bound to make failures of every thing new he undertakes to construct.

The hull of the light draft monitors consists of three parts. An iron hull, having the form of a scow, 183 feet long and 33 feet breadth; the sides are seven feet deep, the radius of bilge is 15°, her bottom is flat, with 1° dead rise, giving the boat a sheer fore and aft of five inches. Around the sides of this boat, its full depth, runs a water compartment two feet wide. This space is intended to be filled with water when the ship is ready for battle; the valves for this purpose are worked from the inside of the boat, where also the Andrews pumps are placed, which are to remove the water at the pleasure of the commander. This compartment makes the length of the boat 191 feet 3 inches, in width 37 feet. A wooden raft four feet thick and the whole depth of the boat is, by means of eyebolts, fastened to angle iron rivited to the outside of the water compartment. The raft consists of pine logs running in a fore and aft direction, and fastened to each other by horizontal blunt bolts and vertical through bolts, which fasten at the same time raft and deck beams together. On the outside of the raft the armor is fastened, consisting of three one-inch plates; the lower part of raft, which is ship-shaped, is planked, then felted and covered with thin sheet iron. The deck consists of oak beams placed side by side, tied together with blunt bolts and bolted to gunwale iron which runs around the top of the iron hull and water compartment; the nuts are below deck, so as to be able to draw them tight if they should get loose. The seams of the deck are caulked and the deck is covered with felt and then with two plates. Deck and shaft run about twenty-five feet and sixty feet of ship proper, forming there an overhang to protect the propellers and rudder, making the total length 225 feet, width 45 feet, and depth from top of deck to bottom of boat, nine feet and one inch.

These vessels have one turret, twenty feet inside diameter, built of eight courses of one-inch plate. The motive power is the same as with all other monitors. The turret is armed with one eleven-inch gun and one 150-pound Parrot-gun. The motive power of these boats consists of two engines of twenty-two inch diameter of cylinders and thirty-inch stroke of piston. These engines drive two propellers of nine feet diameter and twelve feet pitch. The air and circulating pumps (there is a surface condensor) and feed pumps are worked by an independent beam engine, the whole being so arranged that there is no possible way to get at the different channel plates without first taking down the cylinder connections. The air pump, discharge valve (the valve which is to keep the water from running from the delivery valve to the hot well) seems to have been forgotten altogether, for it was afterwards placed in an unseemly box in the discharge pipe. These are the main features of the vessel.

The vessels were to draw six feet six inches of water from the bottom of their keel, when ready for service, their calculated displacement being then 1,175 tons; but at the launch it was discovered (that is to say by those parties of the navy, for private parties had foretold everything long before this after they had made their own calculations) that the boats drew so much water, that if finished according to the original design, they would not float. A comparison of the calculated and of the actual weights so far as ascertained will show how this could occur:

	Government Calculation.	Actual Weight.
Boilers and appurtenances	97,000 lbs.	132,592 lbs.
Water in same	87,000 "	
Smoke-pipe	14,000 "	20,348 "
Motive engines	78,882 "	118,462 "

CONSTRUCTION OF THE VESSELS.

Experience has taught, that in building iron ships it is essential that all strain on the ship, no matter from what side coming, should be taken by the framework alone, which should for this reason be strong and stiff enough to bear any strain and twisting the vessel may be expected to encounter. The skin of the vessel ought not to be exposed to any other pressure and strain, but the one incidental to its keeping the water outside the structure. In the construction of the light draft iron-clads, this has been utterly set aside, the skin had to resist the outside pressure without adequate stiffening; besides this, the skin has to bear the entire strain in a fore and aft direction. Of what kind this strain is, will be shown. Any boiler exposed to such pressure and strain, with proportionately so poor bracing as the skin of these ships has, would not be permitted to be used; it does not matter that the pressure on a boiler is from the inside, or as in these boats from the outside. The frames are placed eighteen inches apart; the every second frame runs to the top of the boat; the rest stop short right above the bilge; every fourth frame has a cross floor, rivetted on twelve inches deep of three-eighths iron. There are six athwartship bulkheads, two of which are after considerations. Between deck and cross floors are twenty-four stanchions in different parts of the ship; a single box keelson of three-eighths inch plate runs from stern to stem; there are four short fore and aft bulkheads, enclosing passage way through coal bunkers and turret chamber, occupying, in all, a length of thirty-eight feet amidships; this is all that stiffens the skin, carries the immense weight of deck and all that is on it. The most striking feature in this, is the fact that there is absolutely nothing to give strength, fore and aft, but the little box keelson, for the previously mentioned angle iron running around the top of the boat, is riveted to the skin of the ship outside, and is consequently of no other use but to bolt the deck beams down on it. If the deck had been made the same as in the other monitors, that is with the beams twenty-four to thirty inches apart, from center to center, with a six or seven inch flooring, running fore and aft upon them, the deck would have strengthened the boat to a great extent, and would have been fifty per cent. lighter; as it is, it is by its immense weight a great source of weakness and adds nine inches to the draft of water which might have been saved. The fore and aft strain is caused, firstly, by the motion of the waves, which give alternately different points of the vessel more support, or what is the same, greater displacement, and so makes these other points support, which are not supported enough by the water, as the expense of a strain on all the combining parts; secondly, there is a steady strain on the center part of the ship to break it apart, because the after-part of the boat is heavier than the quantity of water displaced; the last fifty-four feet from the after end of the boat if they were detached would have to displace about 175 tons to float but as the heavy overhang merely rests on the water they displace only about 130 tons, which leaves a steady strain of forty-five tons on the joints aft of the center of displacement. The result of all this is obvious. As soon as the vessel is in the water the pulling and twisting of the structure commences; the rivets, being the weakest part of the boat, give way and the seams commence to leak. The wooden raft around the hull would prevent the boat from falling apart, but as it naturally, from its form and construction, is more elastic than the iron hull, it is of no service in relieving the seams in the least of the heavy strain on them.

A practical illustration of this was given by the L. D. monitor Tunis. She tried to go from Philadelphia to Washington; her flat bottom went like a bellows side, and it soon seemed as if every rivet was started, for she made water to such an extent, after she had been out but a short time, that in spite of the working of all her pumps, the water gained at the rate of five inches per day. She put back, was docked, repaired, recaulked and went away, only to come back again leaking as bad as before. She now lies at the Philadelphia Navy-Yard, a sad memento of the insufficiency of knowledge possessed by the engineer who designed her.

To remedy these evils to some extent, especially as far as their displacement is concerned, fifteen of the twenty boats of this class had their decks raised twenty-two inches, additional cross-floors put in their bottoms, and the old ones strengthened by strapping them together over the top of the keelson; but nothing has been done to strengthen them fore and aft. Five boats have been lightened by removing their turrets with all its machinery, the condensor with its extra engine. The air and feed pumps are worked now by a rock shaft motion from the main engines; by substituting one-quarter inch deck plates in the place of one inch on the largest part of the deck; the cast iron engine room floor is removed and a wooden one is substituted. The pilot house is placed on deck, and in front of it is a wooden platform on which an eleven-inch gun is worked, while a torpedo arrangement is attached to the bow.

It is almost unnecessary to say that the engines are small compared with the engines of our other new war vessels, although *their* chronic disease seems to be, too small engines. The original contract prices for these boats range from $385,000 to $425,000 a piece; the extra changes during their construction and the last general alteration will run this sum up to near $600,000 a piece; thus the nation pays for the mistakes of her children.

H. H.

New York, December 14th, 1864.

Old Men.—Much has been said of old age. Old age is wise, I grant, for itself, but not for the community. It is wise in declining new enterprises, for it has not the power nor the time to execute them; wise in shrinking from difficulty, for it has not the strength to overcome it; wise in avoiding danger, for it lacks the faculty of ready and swift action, by which dangers are parried and converted into advantages. But this is not wisdom for mankind at large, by whom new enterprises must be undertaken and dangers met, and difficulties surmounted. What a world this would be if it were made up of old men!—generation succeeding generation of hoary ancients who had but a dozen years or perhaps half that time to live! What new work of good would be attempted? What existing abuse or evil corrected? What strange subjects would such a world afford for the pencils of our artists—groups of supercannuated greybeards basking in the sun through the long days of spring, or huddling like sheep in the warm corners in the winter time; houses with timbers dropping apart; cities in ruins; roads unwrought and impassable; weedy gardens and fields with the surface feebly scratched to put in a scanty harvest—feeble old men clambering into crazy wagons perhaps to be run away with, or mounting horses, if they mounted them at all, in terror of being hurled from their backs like a stone from a sling. Well it is that in this world of ours the old men are a very small minority.—*W. C. Bryant.*

Moving with the Planets.—In its divinest inspiration, Genius never uttered a more audaciously sublime sentiment than was embodied in the simple sentence of Sherman: "The sun goes north on the 21st, and by that time I shall go north too." To talk of the sun as of an auxiliary—to foreshadow a purpose as certain and irresistible as the march of the orbs of heaven—would be presumptuous in most men; but if Wm. T. Sherman rises to the standard of his lofty promise, no tongue will dispute the universal supremacy of his genius.

A Quicksilver Mine, supposed to be of considerable importance, has been discovered in the center of the city of Valparaiso, South America.

Sermons in Stones.

"A rough stone-wall," says Hugh M'Millan, "in any situation is an object of interest to a thoughtful mind. The different shapes of the stones, their varied mineral character, the diversity of tints, flexures, and lines which occur in them, are all suggestive of inquiry and reflection. Sermons may thus be found in stones more profitable, perhaps, than many printed or spoken ones, which he who runs may read. The smallest appearances link themselves with the grandest phenomena; a minute speck supplies a text around which may cluster many a striking thought; and by means of a hint derived from a mere hue or line in a little stone—almost inappreciable to the general eye—may be reconstructed seas and continents that passed away thousand of ages ago—visions of landscape scenery to which the present aspect of the globe presents no parallel. This flexure of the stone tells me of violent volcanic eruptions, by which the soft newly-deposited stratum—the muddy precipitate of ocean waters—heaved and undulated like corn in the breeze; that lamination, of which the dark lines regularly alternate with the gray, speaks eloquently of gentle waves rippling musically over sandy shores; and the irregular protuberances which I see here and there over this stone, are the casts of hollows or cracks produced in ancient tide-beaches by shrinkage—similar appearances being often seen under our feet as we walk over the pavement of almost any of our towns. Yonder smooth and straited surface of granite is the Runic writing of the northern Frost-king, transporting me back in fancy to that wonderful age of ice when glaciers slid over mountain rocks, and flowed through lowland valleys, where corn now grows, and the snow seldom falls. And if there be a block of sandstone, it may chance to exhibit not only ripple-marks of ancient seas, but also foot-prints of unknown birds and strange tortoises that sought their food along the water's edge; and sometimes memorials of former things more accidental and shadowy than even these—such as fossil rain-drops, little circular and oval hollows, with their casts—supposed to be impressions produced by rain and hail, and indicating by their varying appearances the character of the shower, and the direction of the wind that prevailed when it was falling. Every one has heard of the crazy Greek who went about exhibiting a brick as a specimen of the building which he wished to sell; but in the structure of each geological system every stone is significant of the whole. Each fragment, however minute, is a record of the terrestrial changes that occurred when it was formed; ingrained in every hue and line is the story of the physical conditions under which it was produced. The ten commandments were not more clearly engraved on the two tables of stone than the laws of nature that operated in its formation are impressed upon the smallest pebble by the wayside. Its materials furnish an unmistakable clue to its origin, and its shape unfolds its subsequent history. God has impressed the marks of the revolutions of the earth not merely upon large tracts of country and enormous strata of rock and mountain range—difficult of access and inconvenient for study—but even upon the smallest stone, so that the annals of creation are multiplied by myriads of copies, and can never be lost."

The Gold Mines in Australia.—The Melbourne correspondent of the London *Morning Star* writes: "Mining matters look very healthy, as usual. I have still to report large and valuable yields from many of the older reefs, and also the discovery of some very promising new reefs. Several large nuggets have been reported found during the month. At Majorca, a crushing of eighty tons of cement yielded two hundred and fifty-two ounces of gold. From Wood's Point, some immensely heavy yields are reported—one of 1,005 ounces of gold is said to have been taken from one hundred tons of quartz. Another claim yielded forty-seven ounces per ton. From the Ballarat deep leads large returns are still received. The Koh-i-noor Company obtained 2,024 ounces for the fortnight, giving a dividend of £150 on each original share, after receiving £2,600 towards expenses."

Extraordinary Early Masonic Remains.—In the report of the Tin Hill Mine, furnished by Capt. John Martyn, the agent, to the *Mining Journal*, he announces the discovery of a stone coffin, or walled grave, in the form of a coffin, about seven feet long, twenty inches deep, fifteen inches wide at the end, and two feet six inches at the breast. In the coffin there are about four gallons of ashes and a few cinders, and in the ashes he found a seal of yellow metal, in good preservation, with the Masonic arms engraved in the stone. Capt. Martyn has ordered the coffin to remain undisturbed for the inspection of the antiquary, or other scientific explorers of ancient British remains. The mine is in St. Austell parish, Cornwall.—*London Mining Journal.*

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, March 4, 1865.

There is no perceptible change in the condition of the money market. Capital in Bank is still very abundant, and borrowers in good standing find no difficulty in obtaining a reasonable line of discount at 1¼@1½ per cent. per month.

The increased activity of the share market has occasioned some demand for money and loans in bank upon good mining stocks are negotiable at 1½ per cent. per month. Some of the Brokers, upon the same description of collateral, accommodate their customers at 2@3 per cent. per month, but are less discriminating than bankers, and do not exact so wide a margin from current market value.

Receipts of gold and silver since Saturday last exceeded one million dollars, and for the month of February amounted to a fraction less than four millions.

The stock market has been characterized by unusual activity and the recorded transactions at the Board show a larger weekly aggregate than for many months past. Nearly all leading shares have been in request at enhanced rates, and at the close maintain their strength. The fears entertained a short time since respecting some of the claims upon the Comstock have given place to different views, and it is believed by many well informed parties that recent developments have not only set at rest these apprehensions but have disclosed a certain degree of wealth not calculated upon at any former period. The effect of this has been to inspire renewed faith and to advance prices. A number of prominent dealers maintain that the present condition of some of these mines never was so promising, and that current quotations do not adequately represent the real value.

Legal Tender Notes declined from 51⅜ to 49c, and advanced yesterday to 49⅞c; $247,000 have been dealt in at the Board, and in view of the heavy disbursements here by the Government, large transactions in these notes may be looked for.

City shares are dull, but well maintained at current quotations. North Beach and Mission Railroad was sold at par, and a dividend of ½ per cent. on the capital stock of this company is now payable. California Steam Navigation advanced to 80 per cent., and San Francisco 6's of '58 were sold at 62. Spring Valley Water is held at 51, and San Francisco Gas at 85. The Omnibus Railroad Company have declared their regular monthly dividend of ½ per cent. on the capital stock.

Yellow Jacket has attained the most prominent position on the list, advancing from $1,600 to $1,820, receding to $1,785, rising to $2,025 and closing at $1,950, asked—132 feet were sold within this range. A dividend of $75 per foot will be disbursed to stockholders on Monday next. The product of this claim now exceeds 250 tons of ore per day, yielding an average of more than $40 per ton. A large mass of good ore has been disclosed recently, and the future of the mine is thought to be well assured.

Gould & Curry is in good favor, and rose from $1,650 to $1,750, receded to $1,700, and closed yesterday at about $1,725 bid. A dividend of $75 per foot has been declared for the month of February. We can learn of no new feature in this mine. Sufficient ore is being taken from the old levels to give employment to the Company's Mill, and work upon the large D street shaft is vigorously prosecuted. During the coming Summer, the character of the lode, at a much greater depth, will be fully tested; meanwhile, the present resources of the mine, under a prudent and economical management, will probably be adequate to pay regular dividends to stockholders.

Savage has been active, and 52 feet were sold, advancing from $1,575 to $1,600, slightly receding to $1,585, rallying to $1,620, and held yesterday at about $1,600. The regular dividend of $75 per foot will be disbursed on Monday next out of the earnings of the past month. Telegraphic advices received yesterday state that the Potosi chimney is looking finely.

Belcher has continued to advance, and 8½ feet were dealt in at $1,275 per foot. A dividend of $60 per foot has been declared for the month of February, leaving a handsome supply in the treasury of the company. $1,250 is now bid ex-dividend, $1,300 asked.

Crown Point rose from $920 to $1,010, fell to $990, and advanced at the close to $1,200. At these rates 37 feet were sold. The Company are now hoisting a larger quantity of ore and have given employment to outside mills. The ledge at the 250 feet level is improving as development progresses.

Chollar has been largely dealt in at fluctuating rates, and 302 feet were sold, opening at $650, advancing to $710, declining to $615, rising to $720, dropping to $650, rallying to $695, and closing at about $665. No change has taken place in the general character of this claim, so far as we are informed, and with a little more discrimination in the selection of ore for reduction, it is said that better results can be obtained.

Potosi has met with trifling sales at $790@$750 per foot. The mine is yielding about 150 tons of ore daily. (averaging some $40 per ton) and taken chiefly from the 430 feet-level. Other portions of the claim are looking well and it is believed that the earnings of the present month will liquidate the entire indebtedness of the company.

Confidence, (G. H.) is held at about $2,000 per foot—little or none offering. A dividend of $100 per foot has been made for February.

Ophir is in less favor, declining from $415 to $380, seller 60, rallying to $400, dropping to $385, and closing at $380. Hale & Norcross fell from $260 to $245 and is now offered at $240.

Uncle Sam rose from $300 to $360, receded to $325, and sold yesterday at $330, within which range 119 shares were dealt in. Overman was sold at $200 per share.

Empire Mill & Mining Co. was sold at $475 per share.

Imperial advanced from $145 to $150 per share and is now held at $143, ex-dividend of $8 per share paid yesterday. After the payment of this dividend a balance of $22,000 remained at the credit of the company. In drifting north from the shaft at a depth of 450 feet another large deposit of fine ore has been found.

Bullion is in rather more favor and 258 shares were sold, advancing from $108 to $115, closing at about $110 bid.

Burning Moscow seems to attract less attention as a speculating stock, 1,646 shares have been sold within a range of $65@$52½, closing at about $54.

Lady Bryan has been sold to the extent of 400 shares at from $8 to $10½, closing at $9.

North American was sold at $30@$32, and Bajazet at $13.

The total sales of Stocks and Legal Tenders since Saturday last amounted to $1,049,745.50.

INVENTORS AND INVENTIONS.—Let us not cheapen inventions, but be kind to the inventors; beware of killing the goose that lays the golden egg! Many inventors die before the hour of triumph; others falter by the way. Invention is a struggle, a conflict, almost a battle; if the victors are rewarded, the dead are honored and the wounded carefully attended to. Glorify the inventors who succeed; cover with an indulgent self-respect the faults of those who fail; and soothe the last years of the wounded—those invalids of industrial science who have known only the pains of the fight, and always remained ignorant of the joys of victory. —[Dumas.

Sale at 600 dollars up to 800 dollars	7 50 per foot

From $800 to $3,000 per foot, one per cent, on the amount of purchase or sale.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

FRANK LAWTON, Secretary. J. B. E. CAVALLIER, President.

Mining Summary.

CALIFORNIA.

THE COPPER INTERESTS OF CALAVERAS.—The stagnation which prevailed during the past year, paralyzed the copper interests of this county as well as every other branch of business throughout the State. A brighter prospect is now dawning, and this year will revive the enquiry which prevailed in 1863, in regard to copper. That it exists here in mines that will pay for opening, there is now no doubt. The recent heavy sale made by owners in the Union claim at Copperopolis, proves that capitalists have perfect confidence in the quality and durability of that particular lead. The Keystone, at the same place, is supposed by many to be equally as good a lode, while on the same range there are other claims which have been partially prospected, and promise, at no distant day, to prove as valuable. There are reasons why the best claims are often first discovered; but they by no means prove that others do not exist that may be remunerative. The best claims usually have the largest croppings; and those whose business it is to prospect for a particular mineral select the best indications which can be found. From this fact, the saying has long gone into proverb, that the richest claims in a district are always the first found.

At Campo Seco, parties have been at considerable expense in prospecting the copper leads found there. Up to this time, it is true, none of the claims have been profitable; but yet there is every prospect of ultimate success. The Campo Seco company have a vein nearly thirty feet in width at the depth of about 100 feet, which assays as high as twelve per cent., and are now sinking their shaft down to pierce the lead 100 feet below the present level. If the quality of the ore increases in richness, and the width continues, they will have a claim as valuable as the Union.

The Lancha Plana company have hoisting machinery on their works, driven by steam, which enables them to work their mine to advantage; but at the present discount on Government paper, it will not pay to ship their ore to the Eastern market.

The Copper Hill company have a good lead, which will eventually be worth a fortune.

At Copperopolis they are now engaged in erecting large smelting furnaces, by which they can reduce their second and third qualities of ore to pig copper, and thus save the expense of shipping the raw material to a foreign market, which is attended with great expense. If the experiment proves successful, furnaces will be built at Campo Seco, and ore which is now valueless will pay a large profit.

Shipping ore has been struck, within a few days, on the San Domingo range, near the Fourth Crossing, in the Buckfield claim. There are several companies at work at present on this lode, with every assurance of ultimate success.

The plentiful rains with which we have been blessed this Winter will give us plenty of water during the next Summer, and in 1865 the mines in this county will produce a far larger amount of dust than they did in 1864. The year has opened auspiciously, both for miners and farmers, and, before it closes, we shall see better times and more money in circulation than there has been for the past twelve months. The country can stand a little prosperity.—*Calaveras Chronicle.*

THE San Andreas *Register* says two miners have struck a very rich claim near Chile Junction, where they have been taking out the gold at the rate of $100 a day, finding coarse pieces weighing from one dollar to ten; and that three miners at El Dorado, have been taking out the gold by the pound, having taken out $15,000 in six days, which is at the rate of over a pound a day. They found one piece which weighed three pounds.

MINING IN TULARE.—A correspondent of the Visalia *Delta*, writing from a place called Tail Holt, January 29th, says: The attention of the mining population is devoted to quartz, of which there are many excellent leads. I was shown some rock taken from a lead now being worked, which it is estimated will yield from $150 to $200 per ton. Taking advantage of a fine clear day last week, I made a visit to what is known as Slate Range, in this district, about three miles across the hills from town, and where I found plenty of leads and an abundance of rich quartz; foremost of which stands the Josephine, from which a great deal of rock has been extracted, paying, in the average, about $70 per ton, with very imperfect machinery, and poorly adapted to saving gold.

The Louisa, or as it is more popularly called, the Woody, is a well defined ledge, varying from two to three feet in thickness, and the croppings can be traced for 1,800 feet on the surface. The owners of this ledge are not having any rock crushed, but are waiting for the completion of a mill with improved machinery, now in course of erection on White river, in the immediate neighborhood of their lead. This appeared to me to be one of the best ledges in the district, owing to the facility and cheapness of working it, no timbering being necessary in tunneling, the ledge standing nearly if not quite perpendicular. The formation of the hills through which this ledge runs is soft slate or sandstone, very easily worked.

The Sarah Campbell is another rich ledge, not far distant from the Woody, from which I saw some beautiful specimens of quartz glittering with gold.

THE MINES OF TUOLUMNE COUNTY.—The Sonora *Democrat*, of February 11th, says:

No county in the State possesses richer mines of the precious metals than does the county of Tuolumne, and we are rejoiced to hear that capitalists are at last turning their attention to this quarter. We understand that a New York company has purchased the mines in Quartz Mountain, paying therefor a good round sum—yet nothing, we opine, commensurate with their value—and will commence in a short time their operations on an extensive scale. The impetus that this company will give to the mining interest cannot but prove advantageous to the county. There are hundreds of other rich mines that only need the aid of capital to make them yield their treasures in amounts that would fairly astonish the outside world, and we have a hope that the aid will soon be furnished by agents of Eastern companies who are now in the State seeking investment. Let them pay Tuolumne a visit before investing, and we guarantee they will never regret it.

Besides the rich gold mines we have to offer them, we can point them to our innumerable copper mines, that indicate a richness unequaled by any in the State, at the depth to which they have been penetrated. They are, however, mostly in the hands of parties unable to develop them, and must as a consequence—the greater portion of them—remain unproductive, unless aided by capital. The opportunity offered to invest in these mines we hope to see soon taken advantage of, satisfied as we are that they will open up an interest equal, if not greater, than that created from our gold mines. These mines are situated on the range leading from Copperopolis, and the character of the ore is the same. The veins are wide and well defined, and there is no reason to doubt an abundant yield of shipping ore when the requisite depth is reached. Among the many claims now opened, and which from the prospects obtained, commend themselves to the attention of capitalists, we may mention the Halsay, Ukas, Jamestown and Copperhead, near Montezuma; Copper Mountain, near Green Springs; the Knickerbocker and Solambo, near Don Pedro's Bar, and the Rising Sun, on Moccassin Creek. There are many other claims that have shown flattering prospects in metals, but those above mentioned have been so prominent as to attract the attention of the public abroad, and secure for them flattering mention.

NEVADA COUNTY.—The Irish and American Company at Birchville cleaned up, last week, after seven days' washing, and realized the handsome sum of $12,000. The claims of this company are among the richest of that rich mining region.—*Nevada Gazette.*

GOOD PAY.—The editor of the Grass Valley *Union* has seen a gold bar weighing 200 ounces, the product of five days' crushing of quartz from the Potosi mine, on Gold Flat, near Nevada. This company has cleaned up 500 ounces within the last two weeks.

ESMERALDA.

SILVER.—Mr. Pat. Reddy, who arrived in Aurora on the 17th ult., from Montgomery district, brought with him two silver bricks, the result of the first blast of Sol. Carter's new smelting furnace.

Quite a number of men are now engaged in taking rock from claims in this district that have not been worked for several months. A number of companies have granted permission to private parties to take rock from their (the companies') leads, for a small consideration.—*Esmeralda Union.*

HUMBOLDT.

The *Register* of recent dates give us the following items from Humboldt county, Nevada:

The Evening Star, in Trinity, has first rank as a live mine. The ledge came in again, in the bottom of the incline, this week. In twenty four hours sinking, it widened from two inches to twenty-six, and had all appearance of expanding to four feet, when our informant left. The ledge was looking excellent; fully up to the old standard. Voshny thinks, that with nobody to doctor the dump with bed-rock, it will work up to the figures made at Fall's mill. McMurray is working twenty-one men. Sinking uninterruptedly, and breasting out in drifts. He gives entire satisfaction, we believe. Webber's mill will be at work again in a couple of weeks.

The Illinois company, in Indian, is working several men under the superintendence of John Guizelman—one of the best miners in this section. The three shifts are making upwards of thirty feet of tunnel in a week—soft running. A tunnel of 800 feet will cut their ledge (the Moonlight), about ninety feet deeper than the bottom of the shaft, where water came in so rapidly as to stop work.

The Nevada, in Buena Vista, will commence with four men, next Monday—having taken a respite of about three weeks. This company has worked more faithfully than any other in this mountain. It has an excellent ledge (the Peru), and is putting a tunnel in through hard rock, to cut the ledge at a depth of about 200 feet. By estimate, they have about sixty feet to run. The 1st of April, with two shifts at work, ought to show the ledge.

The National, as a company, is doing nothing. Several owners are working on their own responsibility. They take out quartz, pack it down, and pound out the gold with mortars—making big wages.

The Little Giant has wakened. McBeth commenced work in the tunnel, this week, after a long rest. He expects to cut the ledge at an early day in the Spring, and to bring to the light some as good ore as can be found in the mountains.

The Whitmore, in Star, pushes on with its handsome tunnel, night and day.

STAR DISTRICT.—The Sheba has run upon a "horse"—not in the mine, but in the San Francisco office. Business got so lively amongst holders of drafts that Steve King could'nt keep up. The stockholders are slowly paying up the thirty dollar assessment now, and he is paying drafts according to their precedence in number. At this mine, operations have been suspended. The superintendent says that in six weeks he could have it turning out ore as fast as the most importunate draft-holder could ask; but the word came to "shut down," and he shut. The work on the Sheba will be resumed in a few days—so says rumor.

A company prospecting for gold about a mile below town has found fine prospects, and will commence work immediately—sinking a shaft to the bed-rock, and putting up machinery to pump the same. Culter, of the Humboldt Express Co, is just down from Boise. They have started their wagons again, carrying express and passengers. On the 1st of March they expect to start four-horse passenger wagons. A great amount of travel is expected through this way as soon as Spring opens.

ECHO CANON.—The mouth of this deep cut into the western side of the Humboldt mountain is one of the grandest landscape features we ever looked upon. The pass into the canon is narrow—barely wide enough, for about three hundred yards, for a comfortable wagon track. The walls, facing the plain, are solid granite and limestone, and tower frowningly over the approach to the pleasant cañons which lie in the lap of the mountain. These walls rise to a hight of probably 300 feet. At all events, the Devil's Gate, near Virginia, looks tame in comparison. Holt has put on an additional force of men in the Alpha mine, and is getting on teams to haul ore to the mill. His Hanscom crusher works admirably, and the old force was not sufficient to keep the mill going.

BEAUTIFUL ORE.—We saw, a couple of days ago, two sample lots of rich ore, from the Neptune and Ophir ledges in the claim of the Empire Tunneling Co. These are two of the series of parallel ledges known as the Neptune Series. Locations are held, running across the entire series, by the Tallulah, Honcy Lake, and Empire companies. The series of cropping ledges consists of the Mattie Wayne, Neptune, and Ophir. These crop across the claims of each company named above. Besides these three out-cropping bodies of mineral, the Tallulah tunnel cuts two well defined ledges, each three feet in width, between the Mattie Wayne and the Neptune. Some of this ore taken by the Empire Co. from its shaft in the Neptune would yield not less than $600 to the ton.

REESE RIVER.

The following significant items are from recent issues of the *Daily Reveille*, Austin, Nevada:

FINE ROCK.—We were lately shown a specimen of ore taken from the Wall, or Western Oregon mine, that is claimed to be the best piece of rock ever taken out in Reese River. The piece was on exhibition at Van Winkle & Duncan's store, and weighed one hundred pounds, and was estimated to be worth two dollars per pound. It was presented to Prof. Williams, and will, by him, be given to the Philadelphia School of Mining, where it will form a fine cabinet specimen, and an excellent reminder to citizens and students of the unexampled wealth of the distant Nevada. Mr. Going, the Superintendent of the Wall, informs us that he is now taking out large quantities of this superior class of ore.

THE Maggie claim, Yankee Blade, Reese River, pays, according to the certificate of the metallurgical office of Kimball & Murphy, San Francisco, $573.25 per ton. Mr. Hagadorn, formerly of this city, is Superintendent of the mine, and is about purchasing machinery.

THE MIDAS MILL.—Yesterday, inspired by the blue sky and bracing air, we resolved upon a ramble over the hills, and facing northward, soon escaped from the hum of voices, the clatter of stamps, and sought "society where none intrude." As we wandered on, the visions of "green sunny lanes," which delusive imagination had located just beyond each succeeding range of sage covered hills, vanished, and from contemplating crude Nature, we turned our thoughts upon crude bullion, and suddenly awoke from a reverie, to find that we had hauled up at the Midas Mill. Obtaining the "open sesame," we entered, and with Mr. J. M. Dawley, the affable Superintendent, for cicerone, proceeded to explore the establishment, which, after a thorough inspection and (as the legal fraternity express it) mature deliberation, we have no hesitancy in pronouncing it unsurpassed by any mill of equal dimensions in the State. The Midas Mill, under the supervision of J. V. Robbins, Esq., was erected and in operation within three months after the first blow was struck upon the foundation. It was completed at an expense of about one hundred thousand dollars. The building fronts one hundred and fifty-five feet, and is joined by the roasting-room, one hundred and fifty feet in length by fifty feet in breadth, forming an L. The works are driven by a seventy-horse power engine. There is in operation at present three independent five-stamp batteries, capable of crushing from twelve to fifteen tons of ore daily. The company is preparing to erect two more batteries of similar dimensions. There are five furnaces, the most substantial we have yet seen, each capable of being charged with twelve hundred pounds of ore. This portion of the works is an improvement upon the ordinary furnace, and patented by Mr. Robbins. For amalgamating, eight of the largest sized Freyburg barrels and two Varney pans are used. We were pleased with the neatness displayed in every detail of the establishment, and its superiority over ordinary mills, in its economical, labor-saving arrangements. The company owns some valuable mines, among which is the Midas, from which, at the present time, rock is being taken worth eighteen hundred dollars per ton. We were informed that twenty-six men are employed in the building. After a thorough inspection of the mill, we were conducted through the offices and other buildings, all of which are constructed of the most substantial material, and the clock-like regularity with which business is conducted, bespeaks the presence of a controlling spirit of no ordinary ability.

HATTIE.—Hattie is a good name for a mine, and from reports, the Hattie, of Yankee Blade, is one of the best mines, or best places to mine, in all Reese River. The lode is now opened to the depth of seventy-five feet, showing a vein of ore one foot in thickness, from which assays have been made as high as $4,600 per ton, the whole vein working as high as $1,200 per ton. The Butte Mill Company have purchased the right to take out one hundred tons, and it is thought they will clear $20,000 by the operation. The claim was opened to the depth of fifty feet, where the rich ore was struck, by the persevering and unaided labor of one man, the owner of the lode. While his neighbors attempted to discourage him, he worked away, and now considers himself a millionaire. Such is the result of labor at Reese River.

BUNKER HILL.—The District of Bunker Hill, we have contended through the period of its adversity, was one of the best of this famous Reese River country. The late working of a lot of rock from the Starr King and W. B. Astor lodes of that district, belonging to the Sterling Silver Mining Company, have proven, by the severest test, the great richness of those mines. T. L. Burton, Esq., the Superintendent, and Col. R. D. Massey, the Secretary of the Sterling Company, called at our office yesterday, having with them two silver bricks of the respective value of $305.87 and $218.60, obtained at the Oregon Mill—the first from 1,740 pounds of rock from the Starr King lode, and the other from 2,143 pounds of rock from the W. B. Astor. These were 980 and 981 fine, showing either that the working was very good, or that the rock was very free from base metals. The company will immediately commence the erection of a 20-stamp mill.

BULLION FROM EGAN.—Theall & Co. received 6,000 ounces of crude bullion from the Social Gold and Silver Mining Company, at Egan Cañon, on February 24th. The silver tide from Egan has set in and will steadily increase in volume.

RICH PLACER.—A miner, in prospecting for a lode near the top of Lander Hill, struck upon a body of exceedingly rich ore. He thought, of course, that his pile was made, but a few hours' work proved that it was but a piece of float rock. He, however, obtained upwards of a hundred pounds of ore, and gave a scientific gentleman ten pounds of it to work and ascertain its worth. It was crushed in a hand mortar and an ingenious reverberatory furnace improvised for the occasion, being nothing more than the roof of a common cook-stove. The crushed ore mixed with salt and put in an iron basin was placed on the oven,

and the fire going over it, it was thoroughly roasted. It was then amalgamated in a common camp bake oven, and produced at last a bar of silver worth $27.67, being but very little short of three dollars per pound. It is thought the whole, if properly worked, will pay equally well. This is not an isolated case, it being quite common for miners to find bodies of rich float rock.

WASHOE.

EUREKA MINE.—This claim is situated in Gold Hill district, and was located in 1860, and consists of 1,000 feet, being located west of the Yellow Jacket claim. The first work done on the ground was that of running a prospecting tunnel which was started from the ravine near Crown Point, and pushed into the hill a distance of over 300 feet, cutting a ledge of fair indications. A shaft was commenced last season on the hill, eight by eight in the clear with two compartments, and sunk to the depth of 258 feet, being substantially timbered the entire depth. A drift was run in a direction west of north, a distance of 140 feet, with two cross drifts at the east, each about thirty feet in length, through a strata of quartz of fair quality. A cross drift was also run due west to the wall of clay constituting the casings. At this time the east drift is being run to the Yellow Jacket ground through granite and quartz of a barren quality. The ledge found is pitching to the east, and should the owner's opinions prove facts, and a distinct wall found to exist west of the ledge of the Yellow Jacket, a two-ledge theory will have been pretty clearly established. We hardly think such will be the case, but are very willing to be convinced of the fact, and hope the Eureka will prove profitable to holders of stock.—*Gold Hill News, Feb. 22d.*

A LIST of officers who have held the position of General-in-Chief of the armies of the United States since the formation of the Republic, comprises the following names:

Brevet Brig. Gen. Josiah Harmer, from September, 1789, to March. 1791.

Maj. Gen. Arthur St. Clair, from March, 1791, to March 1792.

Maj. Gen. Anthony Wayne, from March, 1792, to December, 1796.

Brig. Gen. James Wilkinson, from December, 1796, to July, 1798.

Lieut. Gen. George Washington, from July, 1798. to December, 1799.

Maj. Gen. James Wilkinson, (again) from June, 1800, to January, 1812.

Maj. Gen. Henry Dearborn, from January, 1812, to June, 1815.

Maj. Gen. Jacob Brown, from June, 1815, to February 1828.

Maj. Gen. Alexander Macomb, from May, 1828, to June, 1841.

Brevet Lieut. Gen. Winfield Scott, from June, 1841, to November 1, 1861.

Maj. Gen. George B. McClellan, from November, 1861, to July 23, 1862.

Maj. Gen. Henry W. Halleck, from July 23, 1862, to March 12, 1864.

Lieut. Gen. U. S. Grant, from March 12, 1864.

WATER-PROOF SOLES.—If hot tar is applied to boot soles it will make them water-proof. Let it be as hot as the leather will bear without injuring it, apply it with a swab, and dry it in by the fire. The operation may be repeated two or three times during the Winter, if necessary. It makes the surface of the leather quite hard, so that it wears longer as well as keeps out the water. Oil or grease softens the sole, and does not do much in keeping the water out. It is a good plan to provide boots for Winter during Summer, and prepare the soles by tarring, as they will then become, before they are wanted to wear, almost as firm as horn, and will wear twice as long as those unprepared.

Mining and Scientific Press Patent Agency.

SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicates, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S Patent Office, Washington, through the medium of our associate in that city, to ascertain whether anything of the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always entitle the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device; or some other party has taken a similar patent for purposes which resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether anything unusual stands in his way, and that for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is that it notifies the caveator, or his agent, to notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only upon the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and permits to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, except when the invention consists of a mere drawing or of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designe, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impression, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos..	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a reissue.....	30
On every additional power to prosecute.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings which may be connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,
Mining and Scientific Press Office, Government House, corner Sansome and Washington streets, San Francisco.

[ADVERTISEMENT.]

To the Public, and to Millmen in Particular.

As Thomas Varney has not, up to this date, withdrawn his notice in the "Mining and Scientific Press," in which appears the following language:—

"All persons are warned against purchasing machines made at the Miners' Foundry, called 'Wheeler's Amalgamators,' as they are an infringement on my patent, and a suit is now pending in the United States Circuit Court, against the parties infringing;"

In justice to myself I am compelled to give to the public a statement of the facts in the case, and show the position which Mr. Varney and myself occupy as Patentees. He commenced suit against me, and the Miners' Foundry, for $90,000, about the 1st of March 1863, and threatened suit against any and all persons who should buy my amalgamators, thus greatly damaging my business. To show the injustice of this suit against a "poor hard working mechanic," I will quote from the opinion of Judge Hoffman, as rendered in the case last November. He says:

This is an action for the infringement of a patent issued to the plaintiff on the 16th of December, 1862, for an "Improvement in Amalgamators for gold and silver." The machine alleged to be an infringement has also been patented—the patent being dated December 8th, 1863. The defendants deny the alleged infringements, and the novelty and originality of the plaintiff's invention. They have also given notice, under the statute, of various other defences, hereafter to be noticed.

Models of the two machines were exhibited in Court, and a large number of witnesses called to explain their construction and mode of operation. It is apparent that the patented machine of the defendant closely resembles, it it be not substantially identical with, the improved and modified machine now manufactured by the plaintiff. But the inquiry is not whether Wheeler's machine resembles that lately used by Varney, but whether the former is substantially the same as the machine described in Varney's patent. That Varney has, in many important particulars, modified the machine as described in his patent, is obvious. Indeed, his late machines resemble much more nearly in external appearance, and in their mode of operation, the Wheeler patented machine than they do a machine constructed according to the drawings and specifications of his patent.

After describing Mr. Varney's pan and its operation, the Judge says:

It appears, however, that the idea of working ores in a batch, by causing them to pass repeatedly between mullers, the upper one of which is provided with openings at the center, as by no means novel.

J. E. Clayton testifies that, so long ago as 1845, he arranged a machine in Tallaboosa, Alabama, for the reduction of gold ores, which embodied substantially the same principle.

* * * * * * *

In Overmau's Metallurgy, p 267, a similar arrangement is described. * * * It is evident that the author is here describing an existing and well known machine, the usefulness of which has already been ascertained.

It is also apparent that the result aimed at is the same in this machine as in that of the plaintiff, and that the means adopted to accomplish it are substantially similar. In both machines the pulverization of the ore is effected by means of a bed plate upon which a muller rotates, with central openings to permit the pulp to pass continuously and repeatedly between the grinding surfaces until the operation is completed.

Amongst other things the Judge quotes the following from Judge Story:

But in all cases where the patentee claims anything as his own invention in his specification, Courts of law cannot reject the claim, and if included in the patent and found not to be new, the patent is void, however small and unimportant such asserted invention may be.

* * * * * * *

Here the plaintiff claims a particular position of machinery as his invention, and it clearly appears in evidence that the position is not new. It has existed before—not in machines exactly like the present, but in machines applied to analagous purposes, viz; in machines applied for the same purpose as the plaintiff applies them. The objection therefore, is fatal.

In the defendant's machine, the pan in two parts, provided with flanges, packing, &c., to which the plaintiff in his patent attaches so much importance, is not used, but a deep pan is substituted with a wooden cover.

The arrangement of the slots or shoes on the muller is different. The upper muller is provided with spiral ridges arranged to operate with similar ridges reversely inclined on the inner surface of the pan, to raise the pulp and promote the circulation. The upper muller is attached to the shaft by an universal joint, and by a mechanism quite dissimilar to that described by the plaintiff. And for the scrapers are substituted broad guide plates extending and secured to the edge of the pan, and capable of being elevated or depressed by means of a mechanism not found in the plaintiff's machines.

Assuming then—as in the point of view in which we are considering it we must—that each of the several parts of the plaintiff's machine is old, and not separately patentable, it seems clear to me that if the patent for the machine can be sustained, as for a new combination; which I think doubtful, the combination of the defendant is least as nla novel as that of the plaintiff.

We have already seen that the muller rotating upon a bed plate, with central openings, and arranged in a pan so as to create a circumation of the pulp, is not a new invention. The tub, composed of two parts, with flanges, packing, &c., he not claimed to have been used by the defendant. In fact it is now discarded by the plaintiff, and a deep pan, with muller attached by an universal joint, has been adopted by him in his later machines. The infringement, if any, must consist in the use by the defendant of the scrapers described in the plaintiff's patent.

The inquiry thus arises—are the curved plates described in Wheeler's patent, substantially the same in their structure and operation as the scrapers of the Varney patent, and if so, do the latter constitute a "material and substantial part of the things patented by Varney, definably distinguishable from the other part." To determine this question, a brief description of Wheeler's machine is necessary.

The Judge then describes the Wheeler pan and the Varney pan and scrapers, and says:

In the Wheeler pan four plates are used while Varney employs only two scrapers. The form or curve given to these plates in both machines is similar, though not identical; but in their structure, arrangement, and the use for which they are intended, there is an essential difference. The scrapers of Varney are represented as of inconsiderable width, and extending from a ring at the center to the periphery of the muller—they rest apparently upon the surface of the muller, and no means of elevating or depressing them are mentioned in the specifications or exhibited in the drawings.

The plates of Wheeler are of considerable width, and attached to a frame suspended from the top of the shaft, resting upon a vertical screw, by means of which the frame and plates attached to it may be elevated or depressed. The plates extend to the inner surface of the pan, where they are secured by slides. The office of these plates, as described in Wheeler's patent, has already been mentioned. It appears to me that the scrapers of Varney neither serve, nor were intended to serve, any such purpose. [Here the Judge gives his reasons for the above opinion.]

For these reasons I am of opinion that the curved plates of Wheeler differ from the scrapers of Varney in their form and arrangement, their object and effect, and that therefore their use is not an infringement of Varney's patent.

Much testimony was taken to show that in fact Wheeler's invention was prior to that of Varney's and that the latter derived his ideas from the former.

It is claimed by Varney that his invention was, in its essential features, matured and perfected in August, 1861. But this statement seems hardly consistent with his declarations or his conduct.

Varney's application for his first patent was not made until the end of October, 1861. That machine has since been discarded as useless.

If then, at the time of this application, he had already matured and perfected the invention of another and far better machine, he committed a practical fraud upon the public in withholding from them the benefit of his skill and ingenuity. It is certainly strange that he should have gone to the trouble and expense of procuring a patent for his first machine, and delayed, for nearly a year, his application for a patent for the improved machine which he had, as he says; already invented.

It may well be doubted whether, if it be true as Varney states, that at the time of his application for his first patent he had already completed and perfected his improved machine, the suppression would not be fatal to both. It appears in evidence that, so early as December, 1861, Wheeler had conceived and communicated to Stewart & Kirkpatrick at Washoe, the idea of his machine. He explained to them the mode in which the circulation, or over and under current was to be produced, and the guide boards by which it was to be assisted.

In January, 1862, drawings of this machine were received at the Miner's foundry, and Stewart, the partner of Churchill, was desirous of having his pans constructed on that plan. The theory and construction of the proposed pan were fully explained to Varney, who succeeded, however, by affecting to consider Wheeler's pan a "humbug," in dissuading the parties from adopting it, and in inducing them to order pans made on the model of his own patent. These were subsequently discarded as useless. We are driven to adopt one of two suppositions: either that Varney willfully deceived Stewart in inducing him to order an inferior pan, or else that he had not at that time discovered the mode of producing the over and under current, recognized its utility and invented a machine to effect it.

Wheeler commenced manufacturing his machines in January, 1862. He commenced using them in June of the same year. They were constructed at the Miners' Foundry by the defendants to this suit, under the immediate observation of Varney. But in his conversation with Scott, in July, 1862, and in his communications with the defendants, he does not appear to have intimated that he was the first inventor of the Wheeler machine, and that in constructing the latter they were violating his rights. Up to the end of 1862, he continued to have his own pans built at the same foundry; and it be really considered the construction of Wheeler's pans to be an infringement of his own invention, his silence is inexplicable. His delay in applying for his second patent is equally unaccountable. In August, 1861, he had, as he says, completed and perfected his invention of his improved machine, and yet in October of that year he applies for a patent for his first and inferior invention, and delays his application for a patent for his improved and perfected machine until the end of June, 1862—more than a month after Wheeler had taken the preliminary steps to obtain his patent.

It is unnecessary, however, to pursue this inquiry further, for in the view I have taken of the case the question of priority of invention is immaterial.

The Judge then notices the other grounds of defence, and says:

If this view of the effect of that statute be correct, it affords a defence to Wheeler as well as the other defendants. It is not pretended that he has used any machines not manufactured by them, or that he has infringed the plaintiff's rights, otherwise than by receiving from the other defendants the sum agreed to be paid by them on the sale of his machines.

I find, therefore, for the defendants.

[In this candid statement to the public, I should have preferred to have given the decision of the Judge and the findings of the Court in full, but for the great length of space they would occupy; and I will state that the same can be found in the "Mining and Scientific Press," of December 10th and 31st, 1864, and invite their thorough perusal.]

It will be seen by the above statements that Mr. Varney is infringing on my patent right by the use of wide guide plates in his pans, instead of my infringing on his patent. The truth is, he never used any but narrow scrapers in his pans until after I had put my pans in operation, and they had proved a success. None of his pans made prior to the year 1863 ever ran six weeks without being condemned and thrown aside. This may account for the fact the he afterwards altered his patterns and made them like mine, with an open, deep pan, and wide guide plat s instead of scrapers, and put a wooden cover on the pans.

Having established my right in my patent Amalgamator, it is now my turn to protect myself against the infringement of "Mr. Varney, or any other man," and I intend to do it; and all persons are hereby warned not to purchase or use machines called "Varney's Amalgamators," as made at the Union Foundry, Pacific Foundry, or any other place, as they will make themselves liable for an infringement on my patent right.

Having made some important improvements in my Amalgamators, the public are invited to call and examine them at the Miners' Foundry, San Francisco, or at Prescott & Schiedel's Foundry, Marysville, where they are manufactured ZENAS WHEELER

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Saturday Morning, March 4, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Wm. R. Bradshaw—San Joaquin, Calaveras, Merced, Tuolumne, Stanislaus and Mariposa counties.

Mr. Robert Lattimore—Butte and Yuba counties.

FACTS ABOUT REESE RIVER.

Were the facts concerning the developments of this rich and most prolific mining district arrayed together, there is no question but that its best friends would be surprised and incredulous of the grand result thereby promised. The productive ledges are already to be enumerated by the hundred. To be sure many are worked upon a limited scale, sometimes by a single individual, and by hand, yet they are, nevertheless, made to *pay*, and will work out their own improvements and assume magnificent proportions.

The owners of the most noted claims are confident and full of satisfaction, so much so, indeed, that they take too little pains to inform their neighbors, or the public, of the actual progress and success they are quietly attaining, rendering it difficult to obtain items and information commensurate with the importance justly demanded by the miners.

We hope soon to be able to give a general article, showing the approximate amount of bullion known to have been sent from Lander county. In the meantime, we invite the editor of the *Reese River Reveille*, (one of the most faithful and best conducted journals within our mining limits) to lay before us the most correct summing up of the number of producing claims, yield of bullion during the past, the prospect for the future, number of mills and amount of machinery on hand and upon the way, according to the best information attainable. It will be no small task for him to do this, but the matter is of importance and worthy of his best effort.

We have, upon solicitation, been kindly furnished with the following figures, showing the amount of bullion taken from a few claims since about the 1st of June last:

Whitlatch G. and S. M. Co.....	$64,322 48
Diana G. and S. M. Co.....	19,558 20
North Star G. and S. M. Co.....	14,687 49
Southern Light G. and S. M. Co..	5 089 11
Blue Ledge G. and S. M. Co....	1,100 00

The above sums, amounting to over $100,000.00, are only part of the returns received by a single secretary, Mr. J. A. Drinkhouse, of 228 Front street.

Those who are not fully convinced that Reese River ledges are possessed of tangible width and depth can have positive evidence of the following statements. The Whitlatch ledge opened at a width of two feet and at the depth of 140 feet the ledge showed eight feet, with both casings perfectly defined. The ledge at present is broken off, though pay ore is still being taken from the mine.

The North Star ledge, though breaking frequently, has yet held a width ranging from a few inches up to three and four feet. They have an incline now down over 200 feet, and have a well defined ledge. The ore from this mine is very rich, the bars running up to 990 @998 fine, and averaging from $200 to $300 per ton, working result, and assaying from $2,000 to $4,000 per ton. They have now at the mine some 200 tons of ore that will work about $80 per ton, being the inferior parts of the ledge. This ore the company will not have worked owing to the high rates of mill charges.

This Company received a 14-horse power engine upon its ground on the 25th of February, and is in a highly prosperous condition. The engine alluded to formerly ran the steamer Governor Dana.

The Diana has an incline 211 feet down, and a shaft of about 130 feet, with drifts both in the bottom of the incline and shaft, from which large quantities of ore are now being taken. The casings are not so well defined, and the ledge varies from a streak to five feet in width.

The Southern Light lately sunk a shaft and struck a good ledge. The suit between this Company and the Graham and Henning (reported one of the richest ledges in Reese River) has just been decided in favor of the Southern Light. They have also an injunction against the Esther, another rich ledge, but like the Graham and Henning, held to be on the Southern Light location.

The Black Ledge has now a contract for getting out 250 tons of ore.

It must be remembered that the assessments on the mines of Reese River have been mere bagatelles, ranging from fifty cents to one and two dollars; and when this fact is taken into account, the developments so far made are indeed extraordinary. The present season will bring out a wonderful change in the prospects of the Reese River mines.

MECHANICS' INSTITUTE ELECTION.—Considerable enthusiasm (which we hope will result in much good) seems to be manifested in the election of officers, which takes place at the Institute Monday, between noon and 9 o'clock P. M. We gave the regular ticket, nominated by the committee of the Institute, last week. At a meeting held on Saturday evening last, a committee was appointed consisting of Messrs. C. H. Harrison, W. H. Howland, W. H. Knight, Chas. R. Steiger, and A. Phelps, who nominated the following opposition ticket:

For President, Cyrus Palmer, Miners' Foundry; Vice President, W. T. Garratt, Brass Founder; Corresponding Secretary, A. T. Dewey, Printer and Publisher; Recording Secretary, Jacob F. Miller, Miller; Treasurer, John Archbald, Cashier and Secretary of S. F. Savings Union; Directors, H. T. Graves, Wire Worker; J. B. Johnson, Pattern Maker; Geo. T. Bohen, Bricklayer and Mason; W. P. Harrison, Printer; Jonathan Kittredge, Safe Maker; James Macken, Coppersmith; Cornelius O'Connor, Carpenter.

COAL CREEK COAL MINE.—At the regular annual meeting of the Coal Creek Coal Mining Company, (located in Sonoma county) held at No. 522 Montgomery street, on the 2d day of March, 1865, the following officers were elected and duly qualified: John J. Hucks, President; Wm. Ross, Vice President; D. S. Cutter, Secretary; J. P. Cogswell, Tresurer; Board of Trustees, John J. Hucks, San Francisco; Geo. H. Baker, San Francisco; P. T. Arehambou, Geyserville.

ABSENT.—Our senior editor is circulating about the hills of Contra Costa county, enjoying fine landscapes, and partaking of bard fare and other luxuries usually meted out to Californin prospectors. Further particulars may be expected on his return.

MISTAKES IN IRONCLADS.—Our New York correspondent, "H. H.," who is an active, practical engineer and mechanic, exposes a series of errors indulged in by the builders of our first ironclads. The article will bear a careful reading.

PLOWING by steam is a success in England.

EASTERN AFFAIRS.

Monetary and commercial matters at the East continue unsettled and seem to show a lack of confidence in the future. The satisfactory aspect of the military situation has materially modified the popular estimate as to the duration of the war, and, although there is no general expectation of a very early cessation of hostilities, yet peace is considered to be sufficiently near to induce cautious capitalists to prepare for the universal decline in prices expected to accompany the end of the war. So decided is this opinion that speculation is almost without exception, for a fall, and the "bears" controlled the market (at latest dates) both for gold and stocks. Large profits were made recently on "short" sales, and the movement seemed to show no abatement, the leading operators being of the opinion that the public situation warrants the expectation of a further fall. The decline in stocks had failed to attract outside investors into the market, who were, probably, deterred from buying by an expectation that further news of success in the field might depress prices still lower; and, considering the competition of Government securities, oil and mining stocks, it was reasonably supposed that the public would not be readily drawn into speculations in railroad and other securities commonly dealt in on Wall street.

The decline in gold at the East had not really depreciated the price of Government securities. As gold falls the amount of interest measured in greenbacks, diminishes; so that the 6 per cent. bonds which, when gold was 250, paid 15 per cent. in currency, now, with gold at 200, pay only 12 per cent. The 12 per cent in appreciated greenbacks, it is true, is worth as much in purchasing value as the former 15 per cent., but for the interest to retain the former relation to the principal, the price of bonds ought also to decline. At the beginning of last September 5-20's were worth clear of interest, 104, which was then equivalent to 40 in gold; at the present time those bonds are also worth 104 clear; showing an advance in gold price since September 1st of 12. About five months ago the interest upon the gold value of the principal was 15 per cent., now it is 11½ per cent.

INTERESTING PHOTOGRAPHS.

We have been shown by Mr. Mosbeimer two very interesting colored photographs, which he obtained in Germany during his late visit to Europe. The one represents the castle of Wartburg, near Eisenach, which stands on a lofty and picturesque mountain. This castle has of late years been thoroughly renovated and ornamented, without destroying, however, its ancient appearance. On every wall are historical paintings, illustrating the founding of the castle and histories of its occupants down to the time of Martin Luther, who occupied one of the rooms in this interesting place.

The second picture represents the room occupied by that Catholic monk, Martin Luther. In this room he translated the Bible. The view from his window is very romantic, and may be about 600 to 800 feet above the town, which he could overlook. The room itself is small; it may be eleven by fourteen feet, and looks more like a genteel prison than a resort of relief. The furniture in the room is the same as used by the great Reformer. On the walls hang the portraits of his father and mother, and near his bed is seen, in the stone wall, the plaster knocked off, which is said to be the identical place where that distinguished Divine threw the ink-stand after the devil, which personage he supposed he saw in the room. The present Grand Duke, who now owns the place, charges a small fee to visitors to support the guides who exhibit and explain all the curiosities of the place. It will well repay every one who visits Germany to go and see this historic and romantic place.

LET no man drop an ill-gotten guinea into his pocket and think the pocket unconscious of the wrong. His very glove shall babble of the bribe that has burnt his hand, and his cravat shall tighten like a rope about his throat.

YANKEE MILITARY ENGINEERING.

Our Yankee Commodores, Generals and Engineer officers seem to entirely set aside all books and precedents in their military operations. They build mailed forts to rotate on pivots, and float them about on our oceans, bays and rivers, wherever they may be needed, to attack the old-fashioned stationary defenses. They go back to the days of the early Romans for an idea, upon which they improve, and construct large rams of massive iron, with which to crush in the sides of their enemies' vessels. They manage to haul monster cannon, of a calibre hitherto unknown, far out upon soft morasses, where it has ever been thought nothing but web-footed birds could find a footing. Military circles everywhere, the world over, were astonished at the utter indifference with which Sherman treated military tactics in his late advance from Atlanta. When our engineer officers wish to construct a railroad, although they have an abundance of the best labor at hand, they ignore the pick and spade, go in for a light job, and lay their rails up hill and down, with no more grading than would be done for an ordinary turnpike. A correspondent, describing the military railroad along Gen. Grant's rear, connecting the various divisions of his army from left to right, says the line of road "is a very curious one, dipping into and crossing two or three marshes, and rising abruptly over several hills. At times, the trains disappear altogether in the hollows. This railroad is one of the wonders of the day, and proves, conclusively, that cars can be run over the rough country without much trouble. Thus it is that our officers, both on land and sea, throw books and precedents to the dogs, go in on common sense, and win at every turn.

RICH ROCK.—A lot of 1,100 pounds of rock from the Osceola mine, Montgomery District, Esmeralda, was worked a few days since at the Metallurgical works of White & Murphy, on Bryant street, in this city, which yielded at the rate of $2,740 to the ton. The rock assayed at the rate of $3,241. It was a very difficult ore to work, being a capriferous silver ore, (silver glance,) containing about 16 per cent. of antimony. Over seven tons of ore from this mine was recently taken to Aurora for working, which yielded within a fraction of $96 per ton. The ore worked by White & Murphy was selected from this lot. It is claimed by the proprietors that one ton of ore as good as that worked in this city, can be taken for every twenty tons of ore as it comes from the mine.

MORE COAL.—The Daniel Low Coal Company, in the vicinity of the Truckee river, has struck a vein of coal at a depth of 304 feet. Their capital stock is to be increased to the amount of $274,000. The coal is said to be of the English cannel variety. The coal was struck by boring. The holes were put down at a short distance apart, each of which passed through the seam, which was about eight feet thick. A working shaft will be put down immediately, and the necessary machinery erected for hoisting, pumping, etc.

NEW LEATHER FROM OLD.—According to the Salem (Mass.) *Gazette*, parties in that vicinity are engaged in manufacturing new leather from old, on the "shoddy" principle. This fabric, says the *Gazette*, is a manufacture from refuse scraps of leather, which are reduced to a pulp by grinding and maceration, and reconverted into solid "sides" of leather by pressure. The article thus produced is used mainly for inner soles, but to an unprofessional eye it seems as suitable for all the purposes of leather as the original article.

OWYHEE MINES IN NEW YORK.—A letter recently received by a gentleman in Portland, Oregon, speaking of the Idaho mines, says that there is a general interest felt there in relation to the Northern mines, and that those who have gone on to organize companies will have no trouble to raise all the capital they need to work on, if they have "their papers right." Already five or six mills are on the way from New York, bound for our upper country.

Do Clay Seams Exist in Mineral Quartz Veins?

EDS. MINING AND SCIENTIFIC PRESS:—In an interesting article on the "Formation of Clay Walls or Seams in Mineral (quartz) Veins," in your last issue, it is remarked "that clay seams are formed by attrition of a quartz ledge against the walls, or one part of the vein against another part." It is true that the formation of clay seams may be accounted for by the laws of motion, and also that the attrition of the ledge against the walls or side of the fissure will form them; but that they may be formed by the rubbing of one part of a quartz ledge against another part of the same ledge is, chemically, an impossibility. Quartz, we all know, is pure silica, and lacks one of the principal elements which enter into the composition of clay—viz: the alumina. We may rub or grind quartz together until the crystals are thoroughly pulverized, and it will remain as we see the tailings from a quartz mill; hence, clay seams cannot be formed in and from quartz alone, and to form clay seams a character of rock foreign to the vein matter and containing the needed element—alumina—is required.

The fact that clay seams cannot exist in quartz veins is one of no little importance seriously affecting, as it does, the "one-ledge" theory. Let it once be generally understood that quartz alone will not form clay, and that clay seams, where occuring in our argentiferous regions, are only produced by the attrition of the quartz forming the vein matter against a wall of porphery or granite; and it will be *prima facie* evidence that a clay seam indicates a side of the fissure and the existence of a wall, and, in consequence, *a separation of fissures or ledges.* X-PERT.

NEW ANIMAL AND BIRD TRAP.—Mr. Jay Wheelock, of this city, has invented and patented a new and curious trap for gophers, rats and other animals, which consists of a box, upon which is placed a wheel having four platforms. This wheel revolves upon the box, but is held in place by means of a pin and notches cut in the arms on the paddles of the wheel. At one end of the box, and elevated above it, is placed a frame-work, with a grate or bars in front, which neatly shuts up from behind by means of a door, in which is placed the bait. Extending up through this frame is a bar, to which is attached a spring, which connects with the pin that holds the wheel upon the box. The animal mounts the box and proceeds to the wheel, places his nose against the bar, which is easily moved, and displaces the pin, when down he goes into the box, and the wheel comes up again, and the trap is set for another victim, and so on until the box is full. This invention must be very valuable to farmers, as it can be placed upon a grain bin, and perhaps be made a receptacle to hold all the rats it will contain. It can also be placed upon a level with the ground for gophers or other animals, and needs no attention but to discharge it when full. Probably a whole menagerie of animals, including snakes and grizzlies, could be obtained by the use of this device. The above invention can be seen at No. 3 Milton Place, on Bush street, above Kearny.

THE SPRING FRESHET.—People up the river are anticipating a heavy Spring freshet, and large overflow of the river where the country is not protected by levees. It is said that there is now more snow on the mountains than there has been for years, and it extends in great depth down among the foothills. If the snow now on the ground should melt suddenly, there would be a great rising of the waters.

FOR THE LITTLE FOLKS.—It is said that there are $300,000 worth of dolls manufactured annually in France; while military toys, such as guns, drums and swords, figure at nearly as large an amount. The entire amount of the toy manufacture, at wholesale valuation, is estimated at $1,000,000.

CHAS. COLLINS has abandoned his project of starting another "California journal" in *New York.*

Communication.

MESSRS. EDITORS:—"Josh Billings" objects to eats, because "if yew tred on thar tales thu git mad rite orph." "Delta" appears to be incensed. It is a great misfortune to be thin-skinned. "Delta" has Plattner's process on the brain, and can't understand that I speak only of Calvert's, in which the ore is moist, and other conditions differ from those with which he appears familiar. I confess, however, to having supposed that the ore was moistened in Plattner's process also, as I was so informed by Mr. Deetken long ago. But I will inform "Delta" that I have seen plenty of matter, including tailings, which would assay much higher than $70 per ton, in which he would be puzzled to see gold, and yet the gold was not in the form of a sulphide. I suggest that after "bad roasting" the precious metal might be contained in the undecomposed pyrites. I can sympathize with "Delta" in the matter of typographical errors—the very reason that I refrained from noticing several points which struck me as erroneous in his letter; but I cannot think that the "typo" was guilty of *all* those blunders.

In alluding to the effect of sulphuretted hydrogen on the per-salts of iron, I merely wished to point out the absurdity of claiming a certain effect for chlorine, which still insisting on the presence of another substance having a precisely opposite tendency, especially as by "Delta's" own showing, there must have been a deficiency of chlorine in the cases referred to.

I *have* heard of "strong acid" and strong vinegar, wine, and many other substances of which water or some other diluent is an implied constituent. Moreover, I once gave a friend a sniff of chlorine gas, and from the effect produced am inclined to infer that he thought it decidedly *strong;* but I never heard of strong oxygen, carbon, or silicon. I presume "Delta" would recommend the use of strong mercury for amalgamating weak gold. "Strong chlorine" will do for a mere workman, but it is not the language of science.

"Delta" does me the honor to intimate that I am a "theoretical chemist." I cannot return the compliment, but will inform him that I am also a practical miner and worker of gold and silver ores. "*Ke epyo urtem per,*" Delta.

C. A.

REMARKS.—Less sensitiveness and personality on the part of correspondents, we think, would be heartily endorsed by our readers.—EDS. PRESS.

ENTERPRISE.—It is stated, in a Virginia paper, that some parties from San Francisco are about erecting a mill for the reduction of ore at Hot Springs, about eight miles distant from the Desert Mining District, intending to use the water of the springs, and claiming that a most material saving in fuel can be made from the use of hot water, so kindly warmed by Dame Nature.

STEAMER ARRANGEMENTS.—The steamship North Star broke her shaft just before her arrival at Aspinwall. Owing to this accident, there may be no steamer in readiness to receive passengers for New York at the Isthmus. The agents of the Pacific Mail Steamship Company dispatch to-day the St. Louis, instead of the Golden City, to convey passengers and treasure for Europe.

THE Providence correspondent of the *Scientific American* tells of a man in that city who is now taxed for $700,000. Some years since one of his debtors failed, and settled with him by giving him a few shares in the Screw Company, and that is what has built up his fortunes. It is not unusual for the company to pay ten per cent. per month for months in succession.

USE OF HORSE FLESH.—The North British *Agriculturist* says that the attempts to popularize the use of horse flesh have been very successful in Vienna. Several butchers' shops have been opened in that city for the sale of this meat, under the authority of government, and with a regulated superintendence. The permission was first obtained a few years since, but of late the business has considerably increased.

BOILER MAKER'S ASSOCIATION.—At the semi-annual meeting of this association, held in this city on Saturday evening last, the following gentlemen were elected officers for the ensuing term: President, John J. Cully; Vice President, John McGreavy; Recording Secretary, James Hunman; Financial Secretary, W. W. Canty; Trustees: Joseph Plunkett, Thos. Molley and John Bush; Business Committee: John McManus, John Murray and Patrick Casey; Treasurer, Wm. Brady.

OIL OR CHINA.—By reference to a report published in another column, the reader will gain some information on the method of boring oil wells in California. The Santa Cruz Petroleum Oil Works Company now have their well down 84 feet. Pluck and perseverance deserve success. We have faith that the company will win, the Superintendent having promised to go down till he "strikes oil or China."

AMERICAN GUNNERY.—It is said that in the fight for opening the inland sea of Japan, the American steamer that was furnished had a single rifled Parrott gun on board, and it did greater execution than the best Armstrong or Whitworth guns that belonged to the British fleet. A brass 30-pounder, captured from the Japanese, is to be sent to Washington as a trophy.

A PROJECT is on foot in Spain to bring about the emigration of one million of Irish laborers to that country. Negotiations, at last accounts, were in active progress. It was made a matter of governmental policy, and a strong probability existed of entire success.

PLAYING FOR EVEN.—The British Government has sent orders to the Canadian authorities to immediately construct British armed revenue vessels on the lakes, equal in number and strength to those placed there by the United States.

WATER MEASUREMENT.—We have received another article on this subject, which will appear next week.

THERE are about 20,000 fifty-vara lots in the city of San Francisco, the title to which is yet unsettled.

TO CLEAN CANARY BIRDS.—These pretty little things are, like meaner objects, often covered with vermin, and may be effectually relieved of them by placing a clean white cloth over their cage at night. In the morning it will be covered with small red spots, so small as hardly to be seen, except by the aid of glass; these are the vermin, a source of great annoyance to the birds.

PRICES are higher by a hundred per cent. in India than they ever were before. The silver rupee, worth about fifty cents, will not buy as much as twenty-five cents will in England. Articles of ladies' dress there cost five times as much as they do at home. And yet India is draining Europe and America of specie and keeps it all. A plethora of gold appears to be as bad as a plethora of paper.

THE VALUE OF WILMINGTON.—Some idea of the vast importance of keeping the port of Wilmington open to the rebels may be gathered from the statement of the Richmond *Dispatch*, that from October 26th, 1864, to the end of the year the following articles, with others, were imported into Wilmington: 8,633,000 pounds of meat, 1,507,000 pounds of lead, 1,933,000 pounds of saltpetre, 69,000 rifles, and 546,000 pairs of shoes.

LAUGHTER and tears are meant to turn the wheels of the same machinery of seasibility; one is wind-power and the other water-power.

THIRTY thousand cords of wood were cut and sold in Lyon county, Nevada, during 1864.

SCIENTIFIC AND MINING JOURNAL.—This is as valuable a publication as is produced on the Pacific Coast, and one which interests all parties. It contains much that is instructive and entertaining, and seems to have the right men at the head of its affairs.—*Spirit of the Times.*

REMOVAL.

The Office of the

Rose Gold Mining Company

Has been removed to No. 338 Montgomery street, Athenæum Building (Room No. 12), southeast corner Montgomery and California streets. [9v10-4t] C. M. PECK, Secretary.

N. LOMBARD INGOLS,

Accountant and General Factor,

No. 32 Montgomery Block.

Address, Box 2128, Postoffice, San Francisco. 9v10

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day are published as Serials, from week to week, in THE GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished talent in the Atlantic States and Europe; including "Orpheus C. Kerr," Fitz Hugh Ludlow, G. B. Densmore, "Mark Twain," Dan De Quille, Florence Fane, Miss Emma Hardinge, Sarah E. Carmichael, Annie E. Fitzgerald, "Occasia Owen," Alice Mason, William Simpson, Chas. F. Stoddart, "Ina," H. C. Willistou, "Albion," "Fairfax," Bonnevel, Mary Kyle Dallas, Margaret Hosmer, and many other accomplished writers of Fiction, Romance, Novels and Stories, Poetry, Essays, Sketches, etc., etc., comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

Subscriptions to be Paid in Advance.

ONE YEAR $4. SIX MONTHS $2. THREE MONTHS $1.

Take care to write distinctly the name of the person; the name of the city, town or locality where the Post office is situated, and the name of the County and State, in order that the paper may be fully and accurately directed to every address.

THE GOLDEN ERA TO CLUBS.

Parties (living remote from localities where agents are located) forming a club of five yearly or half-yearly subscribers, and forwarding the subscriptions (by letter registered and postage paid) to the office of publication in San Francisco, will be entitled to an additional copy of The GOLDEN ERA for the term of one year, or to retain the equivalent in cash.

AGENTS in every part of the State receive subscribtions or the GOLDEN ERA.

POSTMASTERS in California, Oregon, and neighboring Territories, obtaining subscriptions for the GOLDEN ERA and forwarding the same, with name and address of the subscriber, will be allowed a commission therefor.

PARTIES residing in localities where no Agents are established will forward their subscriptions by mail.

SUBSCRIBERS will be careful in writing as plainly and fully as possible, the direction of papers to be sent to any part of California, the Atlantic States, or elsewhere.

Now is the Time to Subscribe.

TO ADVERTISERS!

Best Advertising Medium—The "Golden Era" is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

is universally read in every city, town, village, and mining and agricultural precinct in California, and offers unusual and unequaled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

GOLDEN ERA POSTAGE.

POSTAGE on the GOLDEN ERA, to Mail Subscribers, in California and throughout all the States and Territories of the Union, per quarter, (3 months).... 5 cts. To be paid quarterly, in advance, either at the Office of Mailing or Delivery.
POSTAGE on the GOLDEN ERA, Single Copies, transient, to be prepaid by stamps..... 2 cts.
POSTAGE on the GOLDEN ERA, to Mail Subscribers in the county (San Francisco) where published..... Free.

Subscriptions to be Paid in Advance.

BROOKS & LAWRENCE,

GOLDEN ERA BUILDING,

543 Clay st., near Montgomery, San Francisco

THE COST OF SOLOMON'S TEMPLE.—We copy the following from the *Freemasons' Monthly Magazine*, of December:

What was the cost of Solomon's Temple?—*Builder.*

The Athol Lectures say £69,869,822,500. Of this £62,675,000,000 was for precious stones. £6,904,832,500 was expeoded for gold, silver and brass utensils aod sacred vessels. The wages, diet and clothing of all grades of workmeu, £140,000,000; material for construction, £150,000,000. King David's contributioo amounted to £911,416,207; Solomon's offerings, and those of Hiram of Tyre, aod the Queen of Sheba, £80,000,000,000; leaviog over aod above all expenses, £11,041,583,707 in the King's Treasury for repairs.

Perhaps a better idea of the vast amouut of money expeoded in the buildiog of that magnificeot temple may be formed from the statement that its cost was 175 times as great as our present national indebtedness.

FOREIGN BUNTING.—Amoog the stateoients of the Secretary of the Navy, was one which is not to the credit of American industry. The buotiog under which our soldiers fight and citizens hurrah, is BOT the product of American hands. We rely upon foreign factories for the principal material of which the thousand flags of the Republic are composed. How long shall this reproach last? Maoufacturers of America, see to it that foreigo looms shall no looger have the mooopoly of producing the bunting which floats from our mast-heads and flag-staffs, as the emblem of our assailed, yet surely triumphaot oationality.

Quartz Ledge For Sale.

THE entire right, title and interest in a Quariz Ledge in this State is offered for sale. Abundant and reliable evidence of its richness, with further particulars, will be furnished to parties addressing, with real name, "J. H. W.," Lock Box 1,098, San Francisco Postoffice. 7v10

A Noble Reply.—When the celebrated General Wolfe, nt that time a Lieutenant-Colonel in the English army, was riding over the field of battle with the Duke of Cumberland, they observed a Highlander, who, although severely wounded, was as yet nble to sit up, and, leaning on his arm, seemed to smile defiance at them. "Wolfe" said the Dako, "shoot me that Highlander scoundrel, who dares to look apon us with such contempt and insolence!" "My commission," replied the manly officer, "is at your royal highness' disposal, but I cnn never consent to become nn executioner!" The Highlander, it is probable, was soon knocked on the head by some raffian less scrupulous than the future conqueror of Quebec. But it was remarked by those who heard the story, that Colonel Wolfe from that day visibly declined in the favor and confidence of the Commander in-Chief.

A Magnificent Edifice.—The great Roman Catholic Cathedral of Saint Peter and Saint Paul, recently completed in Philadelphia, and dedicated on the 20th ult., is the largest ecclesiastical building in North America, north of the City of Mexico. The cost is over a million of dollars. The artist who adorned the Cathedral was Constantine Brumidi, Esq. He has been for three years past engaged on the decorations on the walls.

The corpse of a woman was found in her room in St. Louis, lately, four months after her death. She had lived nlone, nnd no one happened to go to her room during her sickness. A scrap of melancholy rhyme was found in her hand.

Machinery.

WM. BRUCKNER'S
Furnace for Roasting Ores,

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron Cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,
5v10 No. 416 Market Street, San Francisco.

IMPORTANT INVENTION.
Hunter's Concentrator, Amalgamator and Separator.

For the concentration of Gold, Silver and Copper ores, and separating all kinds of metals from the sands, where the specific gravity of the metal is greater than that of the rock, a machine is now on exhibition at No. 521 Market st., above First, at Bacon & Webster's Quartz Grinding Works, where it will be running from two to three o'clock P. M., for the inspection of all interested in mining. The Inventor is prepared to manufacture machines to supply all orders promptly. The sixth of a horse power is sufficient to run one of these machines. For the above machine a patent has been applied for. Orders for machines, or for circulars and further information, should be addressed to

ANDREW HUNTER, Inventor.

The following extracts from Reports are submitted to the public as giving the results of a fair working test of these machines:

Bear Valley, Dec. 12, 1864.

Mr. A. Hunter—*Dear Sir:* I take pleasure in stating, in reply to your request, that your concentrator has now been running uninterruptedly, at Princeton Mill, for more than three weeks, and the enclosed notes, by the Superintendent Mr. Williams, of a carefully measured test of its performance during a period of a day and three-quarters, I believe fairly indicates what it has been doing through the whole of that time. First, the loss of the sulphurets, per cubic foot of tailings from the Concentrator, was about one-tenth of an ounce. Second, the loss of sulphurets from the blankets was nearly *fifteen times greater* than that from the Concentrator. The Concentrator has not been found at any time in the slightest manner out of order, and has required scarcely any attention. Congratulating you upon the these facts, I am, sir, very respectfully yours, Fred. Law Olmstead,
Manager Mariposa Company.

Notes of test run of Hunter's Concentrator—it having been supplied during the test with the sands reduced by one battery at the Princeton Mill, in the condition in which they are usually received by the blankets:—

Running time	1¾ days.
Amalgam saved on the plates of the Separator during above time, value	$6 75
Rate of saving of single machine per day	3 86
Rate of saving of six machines per day	23 16
Yield of Sulphurets, 1¾ days, pounds	215
Yield of Sulphurets, one days run of one Machine	123
Rate per day of saving from six machines, being the whole number required for the Princeton Mill	738
Yield of amalgam from plates of Separator, per ton of rock crushed, value	55
Yield of sulphurets from Separator per ton of rock crushed, pounds	18

HANNIBAL WILLIAMS,
Superintendent Princeton Mill.

San Francisco, Dec. 18, 1864.

I have recently examined one of Hunter's Concentrators and Amalgamators, in operation at the Princeton Mill, Mariposa Estate, the sand and crushed rock, flowing from one battery of four stamps, passing directly over the machine, without using blankets. On examination, it shows conclusively that the loss of sulphurets by the machine is much less than by the blankets, being but a mere fraction of the sulphurets, consisting of the light and thin scales, such as can scarcely be saved by panning; while on the other hand the tailings from the blankets contain a large amount of heavy sulphurets. The product of gold per machine is almost pure, clean sulphurets—the copper plates of the machine, being amalgamated, securing much or all of the free gold that escapes the battery. I witnessed the cleaning up of the machine, and the collection of a ball of amalgam. From the weights taken we may state the constitution of this ore, as it came from the batteries at that time, as follows:

Clean Sulphurets containing free gold and amalgam	18.00
Quartz sand, waste	1981.78
Loss of Sulphurets and tailings	.22
Total	2000.00

Wm. P. Blake,

4v10

HISTORY OF THE PLOW.—The first plow is supposed to have been the rude branch of a tree cut so as to have a cleft end, the point of which, dragged along the surface of the ground, scraped the furrow into which the seeds were thrown. It soon occurred to the husbandman that he might relieve his own labor by yoking an animal to the long arm of this primitive instrument; then arose the necessity for a handle, fixed to the back, so that the plow might be guided. The strength of the animal soon wore away, or broke, the cleft of the branch, and this necessity gave rise to the invention of means for attaching moveable shares, first of wood, next of stone, copper, or iron, worked to a shape adapted to the cutting of furrows, so as to avoid the excessive labor from the plowman having to lean upon the plow with all his weight, to press it into the earth. Just such an implement as these conjectures indicate was used by the Saxons. Some of the facts connected with the history of the plow are almost incredible. In Ireland there once prevailed a custom of "plowing by the horse's tail." The draught-pole was lashed to the tail of the horse, and, as no harness was employed, two men were necessary, one to guide and press upon the plow, the other to direct the horse, which he did by walking backwards before the miserable animal, and beating it upon the head on either side, according to the direction required. This custom prevailed for a considerable time, in spite of a law which was passed in the early part of the seventeenth century, imposing severe penalties upon a person found guilty of "plowing by the horse's tail," as in the act mentioned described. From Rev. Cæsar Otway's "Sketches in Erris and Tyrawley," it appears that the barbarous practice lingered in the remote west of Ireland as late as the year 1740. And from a paper "On the Breed of Horses in Scotland in the Ancient Times," printed in the first volume of the "Transactions of the Society of Antiquaries of Scotland," we find it in that country as late as the year 1792.

FURS FROM THE NORTH.—The Russian ship Czarovich recently arrived at this port from Sitka, in the Russian Possessions, with one hundred and eighty bales and two hundred and forty boxes of furs.

To Mining Secretaries.

We positively refuse hereafter to receive advertisements of any mining company for the payment of which the Secretary is unwilling to vouch. We shall also excrcise the right to eject from our columns, at any time during the course of publication, any advertisement for which payment is not made, or security given upon proper notification.

Boot-Blacking Machine.

This late "YANKEE INVENTION" has arrived in California, and can now be seen

At the St. Lawrence Hotel, Market Street.

This machine is a great labor-saving invention, and will be found of especial value in large hotels, and for use at all boot-blacking stands, etc. The public are requested to call at the St. Lawrence Hotel and decide for themselves with regard to its merits, rather than to make up their minds as to its value from some peripatetic news-reporter, who may be a better judge of tangle-leg whiskey than mechanical ingenuity. Rights to use this Machine for sale.
7v10 **A. E. WHITE.**

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine	No.	Fine
Assay..... 250	943	Assay 300	999
Assay..... 285	941	Assay for Czotman	980
Assay..... 286	940	Assay Water Rock	966
Assay..... 291	950	Assay Water Rock	998
Assny.....		St. Helena Ledge, W. D.	966

These, including a number of other batches, were all worked to within fifteen per cent, and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by
J. & W. C. SALMON,
To whom all orders should be addressed. 15

Disney's Cylinder Amalgamator.
The Cheapest and Best.

DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.
M. DISNEY, Patentee.
San Francisco, June 23, 1864. 1-3m

VARNEY'S
PATENT AMALGAMATOR.
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation few have ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**
1v10 San Francisco.

THE NOVELTY.

This **ROTARY CYLINDER GRINDER & AMALGAMATOR** *did not receive* the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up, and, in fact, is a perfect machine.

In offering his Amalgamator to the mining public the Inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker on mining machinery, that there was room for improvement in that direction, and that he has, by careful study, invented his improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.

The Invention consists of a cylinder caused to place horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller (one or more) placed within it, and covered with shoes one and a half inches thick, constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the German Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pan at one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.
H. L. HOPKINS,
1v10 Inventor and Patentee.

DUNBAR'S
PATENT SELF-ADJUSTING
Piston-Packing.

Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.

IT WILL SAVE EACH SEASON MANY TIMES ITS COST in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this VALUABLE IMPROVEMENT, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,
23v8 Golden State Iron Works, San Francisco.

HUNT'S NEW DITCHER.

HAVING SECURED FROM THE INVENTOR THE SOLE right to manufacture those Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to
E. O. HUNT,
Windmill Builder, No. 28 Second Street and 110 & 112 Jessie Street, San Francisco. 9v22tf

PRATER'S
PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address
J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

Illustrated in the Mining and Scientific Press, April 9th, 1864.
HEPBURN & PETERSON.

NOTICE TO MINERS.
NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer.
24v9

TO QUARTZ MINERS.
Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to
PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

ATWOOD'S
Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at
222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

Pacific
BEATER PRESS
Company.

SAN FRANCISCO, CALIFORNIA.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other

HAY AND COTTON PRESSES.

This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay, in dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.

The fact that Beater Pressed hay commands a BETTER PRICE in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.

This press is equally efficient for Cotton, Wool, Pulu, Tow, Hemp, Hair, Manilla, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties interested are invited to call and see one in operation.

Office and Warehouse—MISSION STREET, between Main and Beale streets.

W. H. MITCHELL,
2v10 **General Agent.**

HUNT'S
IMPROVED WIND-MILL.

THIS WIND MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order, they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.
ALSO, THE
Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,
No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

FARRAND'S
Oscillating Amalgamator,
RECEIVED THE
ONLY PREMIUM
AWARDED FOR AMALGAMATORS
At the Recent Industrial Fair
OF THE
Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN, W. T. CARRATT, H. P. WAKELEE,
O. GORI, GEO. JOHNSON, C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavillion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,
R. L. OGDEN, Agent, SAN FRANCISCO.
S. E. corner Montgomery and California streets.

GOLD MINING IN CONNECTICUT.—The Stamford *Advocate*, of January 6th, in alluding to recent discoveries of gold at Greenwich, Ct., says: "We saw specimens of the ore from this mine some two weeks or more since. By an interview with Dr. Keith, a resident of this place, we learn the following facts. The assays from ore taken from the Stamford lode yielded per ton from No. 1, $57.44 in gold; No. 2, $51.70 in gold; No. 3, $71.50 in gold and 4.75 in silver. Only one assay has been made from the Greenwich lode, and that gave $30.90 in gold per ton. The Doctor informs us that the present appearances of the lodes is as good as in the generality of the mines in Colorado. Should these mines prove to be no richer than the yield by the above assays, their value must be very great. After a mine is well opened, it is calculated that ore can be mined and worked at a cost of from $15 to $20 per ton in currency. This would leave a profit of over $30 in gold per ton, if we take the average of the above assays. If there is gold on the surface of these mines, there must be a richer harvest below, and we hope the work on them will be prosecuted with vigor, as we doubt not it will be advantageous to the owners, and we are quite certain it will have a tendency to add much to the wealth and prosperity of Stamford."

AN English paper says that during the few days before Christmas about one hundred and fifty tons of mistletoe were sent to Manchester, Liverpool, and adjoining towns. Who can calculate the number of chaste salutes which were perpetrated under its boughs.

A FAMILY MANIA.—Henry Simon, whose father and grandfather died of self-murder, hung himself in Philadelphia, recently.

THE MINING AND SCIENTIFIC PRESS.—We call the attention of our readers to an article from this valuable journal, explaining some of the reasons why it should be supported. We have no hesitation in saying it is one of the most deserving publications on the coast, in fact, the only legitimate mining journal in California. Every practical pick and shovel miner, as well as every man who may be anywise interested in mining, should have the *Press* for his own information, aside from its scientific value. Its editors and contributors are men of practical experience and qualified to speak that which they know.—*Grass Valley Union*.

A VALUABLE NEWSPAPER.—The "Mining and Scientific Press," published by Dewey & Co., in San Francisco, is a useful and instructive journal for the miner and mechanic offering a vast fund of information respecting the working of metallic ores, the improvements in mining and other machinery, etc., etc. The PRESS deserves a liberal support from miners and artizans. Terms—$5 per annum, or $3 for six months.—*Placer Herald*.

Now in Its Tenth Volume!

— THE —

Mining and Scientific Press,

— THE MOST —

Profitable Newspaper

— FOR THE —

Readers of the Pacific Coast.

Issued Every Saturday Morning.

DEWEY & CO., Publishers.

OUR Journal enters its TENTH VOLUME with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

We believe that the PRESS furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the MINING AND SCIENTIFIC PRESS substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,

An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders.
A Faithful Monitor for Stockdealers,

An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to all Industrial Classes

Upon the Pacific Coast. We shall give accurate and frequent

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and Newsdealers, acting as our agents, will receive liberal commissions.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

SUBSCRIPTION IN ADVANCE.

TO OWNERS OF MINES.

As many mines are being offered in the New York market, and as experience has proved that not one in ten of the titles are in proper form, we will state that the following is considered a good title:—

1. Copy of Notice of Location certified to by Recorder of District.
2. Certificate of Notary that A. B. is Recorder of District.
3. Deed of Power of Attorney from Locaters to party selling, which deed or power of attorney must be recorded in the county in which the property is located.
4. Certificate from County Clerk that Notary and County Recorder is duly qualified.

C. A. CRANE,

9v10-1m No. 4 Cedar street, New York.

IN THE DISTRICT COURT OF THE FIFTEENTH JUDICIAL District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk,
By G. C. LEICHER, Deputy Clerk.

C. Sims, Attorney for Plaintiff. 7v10-3m

Memorandum for Secretaries.

Safe Rules for Advertising.

Make your order levying the assessment on any day EXCEPT FRIDAY, and advertise the Assessment Notice on the FIRST FOUR succeeding SATURDAYS, setting the day for delinquent advertising on the FIFTH SATURDAY, and the day of sale on the SEVENTH SATURDAY, or any day thereafter, PREVIOUS to the EIGHTH SATURDAY.

ADVERTISING IN THE INTERIOR.—If the mine or works of the corporation are located in any State or Territory of the United States, notice must be advertised there also, if a newspaper is published in the same county. On this account, SATURDAY is the best day on which to levy assessments, as thereby the longest period possible is gained for transmitting a copy to interior papers, which are usually published on Saturdays.

POSTPONEMENTS.—The date set for advertising delinquent stock, and the day of sale mentioned in either notice, may be *once* postponed for any period not to exceed ten days. Secretaries can avail themselves of this privilege when assessments are levied on Friday and they are obliged to advertise at the mine on Saturday, or desire to publish on that day at the place of incorporation.

ERRORS, OMISSIONS, OR DELAYS are definitely provided for in Section 14 of the new law, whereby it is plain that, if the advertising is delayed, the Secretary can only fix the dates for delinquent advertising and sale to suit the time he is to advertise, and proceed anew.

WHEN PAYABLE.—It is the usual custom to make the assessment "payable immediately," or upon some date within a day or two from the time of levying the assessment, although the law makes no requisition as to this matter.

BLANKS FURNISHED FREE to advertisers in the MINING AND SCIENTIFIC PRESS, for Assessment Notices, Delinquent Sales, Postponements, etc.; also copies of the Assessment Law of 1864. Copies of advertisements, for sending personal notice to shareholders, printed at $1 per hundred.

The PRESS is the most ECONOMICAL advertiser for stockholders, reliable and obliging for Trustees and Secretaries, and merits the patronage of the mining interests.

Correct blank forms for advertising, and any information desired by advertisers, will be furnished, gratuitously, at the office of the MINING AND SCIENTIFIC PRESS.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Mining Notices--Continued.

Alta Coal Mining Company, Clayton District,
Contra Costa county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 13th day of February, 1865, an assessment of fifteen cents per share was levied upon the Assessable Stock of said Company, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 1st day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. MARTINON, Secretary.
Office, 311 Montgomery street, up stairs, San Francisco. 7v10

GEO. R. SPINNEY, Secretary.
Office, No. 210 Montgomery street.
San Francisco, Feb. 13, 1865. 7-4t

Mammoth Gold and Silver Mining Company, Silver Mountain District, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 12th day of December, 1864, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, or to H. D. Scott, Superintendent, at Silver Mountain.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 3d day of April, 1865, to pay the delinquent assessment, together with costs of Advertising and expenses of the Sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

Office, No. 430 Montgomery street (Room No. 5, up stairs), San Francisco.

NOTICE.—On account of errors in previous proceedings, the above assessment notice is published anew, and stockholders who have paid on the previous notice will be credited accordingly.

7v10 J. WARREN CLARK, Secretary.

Morning Star Gold and Silver Mining Company, Echo District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of December, 1864, an assessment of one dollar and twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to J. W. Shanklin, Secretary and Treasurer, at the office of the Company, No. 625 Merchant street, U. S. Land Office Building, San Francisco.

This assessment is made subject to such credit for the stockholders as may have been allowed them on any payments of assessments, or expenses of incorporation, and the filing of the necessary vouchers on the same.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 1st day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. W. SHANKLIN, Secretary.

Office, No. 625 Merchant street, San Francisco. 8-4

New Year Diggings Gold and Silver Quartz Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 3d day of February, 1865, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, which assessment has been levied to liquidate the debt of the company.

Any stock upon which said assesment shall remain unpaid on Saturday, the 11th day of March, 1865, will be advertised as delinquent, and unless payment shall be made before will be sold on Saturday, the 25th day of March, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

AUG. KUNAST, Secretory.

Office, No. 540 Washington street, San Francisco.
feb4-5-4

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the Mining and Scientific Press. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

MINING AND SCIENTIFIC PRESS.—This well conducted journa has entered upon its ninth volume. It is a sterling periodical, and deserves encouragement.—*Territorial Enterprise.*

New Era Copper Mining Company, Salt Spring District, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 24th day of February, 1865, an assessment of twenty-five cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 1st day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 15th day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

C. H. TOWLE, Secretary.

Office, S. W. Corner of Stockton and Washington streets, San Francisco, fe25

Oroville Gold, Silver and Copper Mining Company, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of January, 1865, an assessment of five ($5) dollars per share was levied upon the capital stock of said Company, payable on the 1st day March, 1865, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 310 Montgomery street, San Francisco, California.

Any stock upon which said Assessment shall remain unpaid on Saturday the 4th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday the 18th day of March 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

ROBERT P. LEE, Secretary.

Office, No. 310 Montgomery street. feb4-5-4

Ontario and Webster Gold and Silver Mining Companies, Montgomery District, Mono county.

Notice is hereby given that at a meeting of the Board of Trustees of said companies, held on the 16th day of February 1865, an assessment of fifty cents per share was levied upon the capital stock of each of said companies, payable on the 20th day of March, 1865, in United States gold and silver coin to the Secretary, at his office, No. 571 Mission street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 3d day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. B. SHELDON, Secretary.

Office, No. 571 Mission street, San Francisco.

N. B.—This assessment includes one of 25 cents per share, levied on the 26th day of May last, and all stockholders who have paid that assessment will be credited the amount of such payment on the presentation of the receipts for the same. [7] H. B. SHELDON, Secretary.

Pioneer Coso Gold and Silver Mining Company, Coso District, Tulare County, California.

And in accordance with law, and an order of the Board of Trustees, made on the 21st day of July, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the salesroom of Jerome Rice & Co., No. 327 Montgomery street, San Francisco, on the 3d day of September, 1864, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

GEO. L. FAULKNER, Secretary.

8 Office, of the Company 411 Clay St., San Francisco.

POSTPONEMENT.—The above sale is postponed until Saturday, October 1, 1864, at the same hour and place. By order of the Board of Trustees.

10 GEO. L. FAULKNER, Secretary.

POSTPONEMENT.—The above sale is postponed until Saturday, October 29th, 1864, at the same hour and place. By order of the Board of Trustees.

15 GEO. L. FAULKNER, Secretary.

POSTPONEMENT.—The above sale is hereby postponed until Tuesday, January 31st, 1865. By order of the Board of Trustees. (18) GEO. L. FAULKNER, Secretary.

POSTPONEMENT.—The above sale is hereby postponed until Monday, the 1st day of May, 1865. By order of the Board of Trustees.

6-3m GEO. L. FAULKNER, Secretary.

Santa Cruz Petroleum Oil Works Company, Santa Cruz County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22d day of February, 1865, an assessment of forty cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 53 Montgomery Block, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 1st day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 17th day day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

W. FELL, Secretary.

Office, No. 53 Montgomery Block, San Francisco. mar4

Silver Creek Mining Company, Keyes Mining District, Mono County, California.

NOTICE.—There are delinquent, upon the following described stock on account of assessment levied on the 3d day of January, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also — Eds. Press.

TO MINE OWNERS.

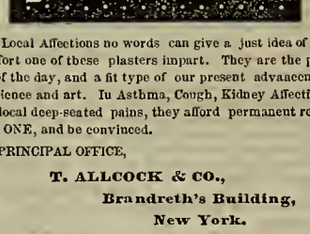
REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in Californin.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address **J. MOSHEIMER,**



No. 338 Montgomery street, Corner of California street, San Francisco. 23v9tfq

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Principal office, Brandreth Building, New York.

W. F. BRANDRETH.

10v2tf Office at Crane & Brigham's San Fran.

In Local Affections no words can give a just idea of the comfort one of these plasters impart. They are the plaster of the day, and a fit type of our present advancement in science and art. In Asthma, Cough, Kidney Affections, and local deep-seated pains, they afford permanent relief. TRY ONE, and be convinced.

NEW YORK METAL MARKET.

Winterhoff & Co.'s Metal Circular of February 3d, 1865, reports the following prices :—

Tin—Straits	58 cts.	
English	26½ cts.	gold
Banca (nominal)	29 cts.	"
Spelter—Silesian	13@ 13½ cts.	
Domestic	12½@13 cts.	
Copper—Lake	45½ cts.	
Baltimore	43 cts.	
Lead—(30 and 60 days, b o)	6 cts.	gold
Galena	14 cts.	

Remarks.—The stock of tin on hand in Boston and New York was 8,500 slabs. The importations for January were 1,000 alnba Bancn ; 2,800 iugots, English.

Stock of foreign Spelter, 900 tons.

The prices of Copper is on the decline ; from 300,000 to 400,000 lbs were sold during the week eading February 3d. The Chile stock is held above the market.

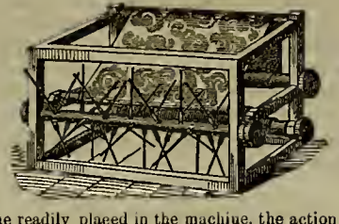
Lead has been dull ; sales of the month, 700 tons ; importations, 900 tons ; stock on hand, 5,300 tons.

Value of Copper Ore in San Francisco.

Wo give the following as an approximate price at which copper ores can now he sold in this city. There is no sale for ores which assny less than 12 per cent. :

	Per ton		Per ton
12 per cent. ore	$24 00	22 per cent. ore	65 35
13 " " "	24 50	23 " " "	69 10
14 " " "	34 00	24 " " "	72 93
15 " " "	37 50	25 " " "	77 20
16 " " "	40 80	25 " " "	80 70
17 " " "	45 10	27 " " "	85 00
18 " " "	49 40	28 " " "	89 10
19 " " "	53 70	29 " " "	93 25
20 " " "	58 00	30 " " "	97 50
21 " " "	61 70		

To calculate the value of ore which assays 30 per cent. and upwards, multiply the per centage by $3.25, and you have the price which will be paid. For instance—suppose you have ore which assays 35 per cent.—multiply 35 by $3.25, and you have $113.75 as the value of the ore. These prices, we believe, will be found substantially correct, and can always be realized.



The Branch Mint.—Mr. John Eckfeldt has been confirmed as Melter and Refiner of the Branch Mint, in this city. This institution will re-open on the 16th inst. The interval is being employed in the settlement of the accounts of the late Melter and Refiner.

At Work Again.—The miners on the Mariposa estate have generally commenced work again, and lively times are once more expected in that region.

Mount Vesuvius, which has been quite active for some time, is still increasing in its activity. No damage had occurred at latest dates, although some apprehensions were felt.

PATENT CARPET BEATING MACHINE.

We give herewith an illustration of a "Carpet Beating Machine," which has lately been introduced into this city, and which can be seen in daily operation at 113 Fremont street. The action of the machine can be readily conceived of by an examination of the above representation. The one in use here, however, has ropes substituted in place of gutta percha whips, the former being found, in practice, to be much preferable. A carpet of any desired width can

be readily placed in the machine, the action of which is such as to render any injury to the fabric almost impossible. Housekeepers are well aware of the injurious effects upon carpets by the barbarous and slovenly way of beating usually employed. A person need only witness the operation of the machine to fully resolve to have their carpets ever afterward submitted to no other process of cleaning. The work by this machine is done far more perfectly than it can possibly be in any other manner, and at quite as little if not less cost. The carpet is beaten entirely upon its back, and, by the mode of application, the blows being made upon the fabric when slightly distended, the dust and grit is not only entirely driven off, but the moths as well—those fell destroyers of woolens and worsteds. The operation may be readily witnessed at the rooms above mentioned, through a glass window, where the observer will be entire free from the dust and smother produced in the process of cleaning.

Powder Mill Explosion.—The "corning mill" connected with the powder mill at Santa Cruz, exploded on the 5th instant, instantly killing a man named James Pollock, employed thereiu. About 150 pounds of powder were burned. The works of this Company are so arranged that very little danger need be apprehended from an explosion, except at the particular point where it occurs.

Torpedoes at Panama.—It is said that an attempt has been made to destroy the U. S. war steamer St. Marys, at Panama. It is said that several floating torpedoes have been picked up near her anchorage. Constant guard is kept about her night and day, in which the Panama authorities assist.

Watches.—Mr. J. A. Philips, foreman of the Challar mine, Virginia, was on Saturday last the recipient of a magnificent gold watch worth four hundred dollars. The watch was presented by the underground employèa of the Company.

More Ore from the Colorado.—The schooner Sovereign, of Hartshorn's line, arrived from the mouth of the Colorado, on Tuesday last, with a cargo of copper and silver ore from the mines on that river.

Petroleum—Interesting Facts in its History.

Petroleum was an article not commonly known five years ago, yet now it is one of our principal exports, is talked about by every one, is regarded as one of the most indispensable products of the earth, and companies organized to develop it, occupy with their advertisements whole pages of the press, filling with "great expectation" the minds of those who are willing to invest in the shares, of which "a few more can be had on early application." It furnishes the best illuminator in the world, in the brilliancy and steadiness of its light, and in economy ; is unsurpassed as a lubricator by any other natural product ; and new uses are every day discovered to which it may be applied. Some of the most beautiful dyes have been obtained from it, and to it also are due flavors that please the most delicate taste. Nothing could seem more providential than its discovery when whale oil has become so scarce and so dear ; and in the minds of many it will soon compensate for the loss of cotton in the balance of exchange. Gov. Curtin, of Pennsylvania, largely interested in it personally, stated that the product of the Pennsylvania wells for 1863 was worth $56.000,000, far more than the value of all the coal and iron products of the State, and this in the fourth year of its discovery !

The word "petroleum" means rock oil, from two Greek words ; and contrary to the supposition of many, this article has been in use for many years in other parts of the world. Herodotus, the Greek historian, spoke of it 2,300 years ago, and for a long time it has been produced in Burmah, Italy, on the shores of the Caspian Sea, in the "Great Pitch Lake" of Trinidad, near the Dead Sea, and in many other places. In India the product has some years been as high as 400,000 hogsheads. In our own country the article has been known long, having been collected and used as a medicine by the Seneca nations near the head of the Genesee river, hence the old name for it, "Seneca oil" and "Genesee oil." It was found on the top of the water in springs and floating on the streams. Among the earliest prospectors for oil was Col. Drake, of Massachusetts, who "struck oil" on Oil creek, in August, 1859, the oil spouting high up in the air, reports of which caused so much amazement at the time, and were received with not a little incredulity. Many immediately rushed to the region ; wells were sunk in great numbers, some of them flowing daily more than a thousand barrels ; and soon the market was so glutted that the oil was sold for twenty-five cents a barrel, and most of the wells were abandoned. This cheapness led, however, to its general introduction, and soon, with increased demand, the price rose, and again the tide of speculation poured to the oil region, which up to this time has every day gained in strength. The land has been bought up at fabulous prices, and the number of companies formed is numbered by hundreds, their capital by hundreds of millions. The profits obtained in some cases have been almost incalculable, and many a poor man struggling hard to obtain a livelihood on his almost worthless farm, has become a millionaire. The income of one young man is estimated at $7,000 a day. To give some idea of the immense income of a large well, we saw recently in a paper a notice of one which produced 800 barrels a day, worth at the well $10 a barrel, giving $8,000 daily income, enough to pay every day twice over the whole cost of boring and machinery. One thirty-second of this well was sold recently for $150,000, at which rate the well would be worth $4 800,000, and at that valuation it would pay annually sixty per cent. All this wealth comes from a hole in the ground six inches in diameter.

The oil region of Pennsylvania is mainly confined to Venango county, in the western part of the State. It is a broken country, full of deep ravines, and the streams bordered by bluffs rising precipitously, leaving but a few rods, in many cases but a few feet, of interval land. On this interval land hitherto all the oil has been found, from which it will be perceived that what is regarded as oil territory embraces but a small portion of the country, probably not one acre in a hundred. The chances of failure are six to one of success, as those say most familiar with the country. Frequently of two wells put down within a few feet of each other, one will produce oil, the other will be barren. If oil is obtained, but little calculation can be made on its permanence. Some wells have produced for several years, others after a few weeks begin to fail, and in a year cease. It is a lottery, with many rich prizes, but they who embark in it must be prepared for blanks.

The origin of petroleum is involved in mystery, and has been the occasion of much theory. Some contend that it is produced from coal ; yet from the lowest bed of coal to the oil is some 800 feet through different strata of rock, and in no instance have coal and oil been found in proximity. Some can take the opposite theory, that coal is formed from oil. A third class believe it to be an original product, still forming in the earth by the union of carbon and hydrogen in the great labratory of nature, and anxious as we all are that the supply should be continued to us, we incline to this theory, in the absence of proof in favor of any. All that has been established so far is that the oil is found in connection with a sand rock, of which there are three interstratified with soapy shale. These sand rocks vary in depth with location, and are not far from 200 feet apart. The average depth of the well is from 400 to 500 feet.—*Newburyport Herald.*

The Augusta (Ga.) Powder Mills.—The importance of the city of Augusta to the Confederate cause may be approximately estimated by the following facts :—"The occupation of Augusta by our troops is an important step, as that city was the source of the greater part of the supplies of munitions of war for the rebels. Their largest powder mills were located here, having a capacity to turn out 8,400 pounds in thirteen hours. These works were established in April, 1862, and since that time over 2,000,000 pounds of powder have been sent to Richmond alone.

The rebels had large stores of charcoal, sulphur and saltpetre, at Augusta. The powder-magazines are built under ground, and are, moreover, divided above ground by thick traverses. The roofs are of zinc, and very light, so that if one magazine blows up it cannot set fire to its neighbors. The rebels also manufactured small arms at Augusta, and at the old U. S. Arsenal small arm ammunition, percussion caps, hand-grenades, etc , were also made. Here, too, they had an ordnance factory and cannon foundry, where they turned out a "Napoleon" a day, made of Austrian metal—a composition of copper, tin, wrought iron and zinc. The capture of Augusta is another blow to rebeldom."

The Miners and Taxation.—The Monitor *Gazette* makes "the bold assertion that the miners of the Pacific coast pay three-fourths of all the taxes that go towards supporting our National, State and county governments, and challenges proof to the contrary."

Favoring the Soldiers.—The heads of departments in Washington have given notice that henceforth clerkships will only be given to those who have served honorably in the Union armies.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Metallurgy of Copper in California.

[By Paul D'Heiry, M. D., Mining Engineer, Professor of Chemistry and Metallurgy, Superintendent of the Copper Mining and Smelting Company, Queen of Bronze, Oregon.]

NUMBER SEVEN.

REACTIONS OF THE SECOND OPERATION.

The ores put into the furnaee are submitted to the action of the gasses which rise from the tuyere to the mouth. These actions are different in proportion as the substances deseend. As soon as they are suffieiently heated, the carbonie oxyd, acting as a reduetive, brings baek the peroxyd of iron to the condition of protoxyd; the dentoxyd of eopper passes to the condition of protoxyd, then, soon, to the metallic condition, and the sulphates of copper become sulphurets. The sulphuret of copper remains intact.

The scoria becomes fused, envelops the produets of the reaction of the carbonic oxyd, absorb rapidly the metallie oxyds, the venistones and the fluxes, and allows to pass intact the sulphurets and the reduced metals. These reactions, that we deserihe here in a single glance, are much more complicated, but it would be useless to examine them all in this little treatise.

Let us see, now, where these reactions conduct us, if the operation has been well done.

1st. The peroxyd of iron, formed at the ealcination, has been brought back to the condition of protoxyd by the carbonic oxyd. This protoxyd of iron, put in eontaet with silica, has formed a silicate of iron, which has run off under the form of scorin.

2d. If there have been injurious bodies present, their oxyds have also been reduced by the carbonic oxyd, and the arsenic, the antimony, etc., have been volatilized in a great measure.

3d. The portion of the oxyd of eopper, formed in the caleination, has been brought back to the metallie condition.

4th. The oxyd of iron has not been reduced into metallic iron, but in a small proportion, because it has been brought down in the presence of silica, with which it has been combined.

5th. The sulpbureted and metallic copper has passed intact. This metallic copper has passed after to the condition of sulphuret at the expense of the different sulphurets and sulphatee. This sulphuret of eopper forms the matt, and cannot he attacked by the other metals.

The six tons of ore will yield eomething like three and a half tons of matt, yielding about thirty-five per cent. of copper.

THIRD OPERATION—CALCINATION OF THE MATT.

This calcination is made in the vaulted kilns. We spread on the grate a bed of wood of moderate eize. Above the hed of wood is placed the matt, broken as we have before snid, having cnre to put the lnrgest pieces below, and the smallest in tbe upper part. We do not raise the heap up to the vault, hut only up to the hight of the flue. We close the front of the kiln with loose bricks, leaving free the part below the grate. We light the wood from below the grate, and as much as possible in its entire extent. The combnstion risee successively up to the upper part, without more fuel, and the temperature is sufficient to produee oxydation in the different parts of the heap.

When the kiln is cooled again we take away the wall of loose bricks, and the calcinnted matt, and we put aside, for a second calcination, all the pieces somewhnt large, to the center of which the oxygen of the air could not penetrate.

For the second fire, to which we re-subject only the large pieces of which we have just spoken, we uee a greater proportion of fuel, because the snlphur, not being in sufficient quantity in the matt, conld not suffice for the combustion. A third fire would not be necessary, but for the very compaet matts, or very lnrge pieces.

Now we have made known to onr readers how we obtain porous matts. There would not he any advantage to make compact matts, but in view of their exportatiou.

REACTIONS OF THE THIRD OPERATION.

When the wood is burnt the cnleination commenees in the mass above the grate. The zone of combustion mount in proportion to the draught of the chimuey, and the pieees of matt are oxydized rapidly at the surface, and slowly in their interior.

In these eonditions, the sulphur gives sulphurous acid. The arsenic and the antimony are volatilized to the eondition of arsenious aeid and oxyd of antimony; the other metals are oxydized, and we do not find, after the ealeination, more than a very light proportion of arsenate, antimonates and sulphates.

In the second fire there has been used a larger quantity of wood, in order to obtain a sufficient heat for the combustion of sulphur, and oxydation of metals. It is to be observed that the matt does not allow the sulphur to distill, like the pyrites of iron, in the first operation, and that, in consequenee, we must aid this combustion hy a larger proportion of fuel.

In this operation the oxydation should be pushed as far as possihle, the sulphur being useless now, and even eould embarrass the work in the following operation, and the more the cnleination is complete, the less there remains of arsenie and antimouy in the matt.

The results of this operation are:

1st. Oxyd of copper.

2d. Peroxyd of irou, in small proportion.

3d. Some sulphurets of copper and iron.

4th. A small quantity of sulphates, arseniates and antimoniates.

FOURTH OPERATION — SMELTING FOR BLAEK COPPER.

We put into the chnrges of this operation, which is made in a eupola furnaee like that of the second operation:

1st. The cnlcined matts of which we hnve just spoken.

2d. When there is any of them, rieh and pure oxydized ores and carbonates, coutaining but little veinstone.

3d. Debris of solo and furnaces; different residue, rieh in copper, and, as far as possible, containing no injurious substances.

4th. Silicious scoria of the firet smelting which may contain granulnted matt. These scoria are indispensable, and should be added in a proportion so mueh larger as there may be more of the oxyd of iron to scorify in the materials which eompose the charge.

The work goes on exaetly as in the smelting for matt. It is to be observed that the more there is of oxyd of iron in the calcined mntt, the more it is neeessnry to moderate the reduetive power, that is to say, the netion of the carbonic oxyd.

When the crucible is full, the fluid metal is tapped ont. It is understood that the exterior basin should be heated before the running. It is from this basin that we draw the metal in fusion, by the aid of an iron ladle to pour it into the moulds.

This smelting gives as its result:

1st. Black copper, more or less impure, containing iron and sulphur, and ahout ninety per cent. of copper.

2d. A rich matt, which should return to the calcinatiou in kilns with the other matts. This rich matt is formed from the sulphur which remains in spite of the careful caleination in kilns. We observe thnt the more the oxydation will be complete in the calcination of matts, the less we will have these mntts formed in the fusion for blnek copper. The formation of mntts, under these circumstances, is always a loss, because they require double work.

3d. A scoria composed of silicate of protoxyd of iron, and of a little oxyd of copper.

We will make the observation here, once for all, that in other countries, all these scorin, proceeding from different operations, are picked out, assorted, and re-worked, however little they may contain of copper. In California this would be a useless and, may be, onerous work.

REACTIONS OF THE FOURTH OPERATION.

The reactions are the same as in the smelting for matt, with some slight differences, which we will now note.

All the copper eontained in the caleiuated matt whieh is formed in the eondition of oxyd or of sulphate, should be redueed by the earhonie oxyd, to metallie stnte, before the seoria became melted, without which the oxyd of eopper would be absorhed by the silica, and would form a silieate of eopper; whereas the silica has no affinity for the metallic copper. As in the second operation, the iron brought back to the condition of protoxyd, by the earbonic oxyd, is combined with the silica as soon as the latter becomes melted. It is in not raising too high the heat of the furnace that we will obtain this double re-ult.

Nevertheless, in the best conducted operation, there is always a little of the silicate of copper formed, and of iron redneed. In this case, the metallic iron reduees the oxyd of copper of the scoria, and the seoria are very poor in copper; but however little the reduced iron be in excess, it passes then into the black copper, and black copper very ferreous presents difficulties for the purifying.

We see, then, that in this operation:

1st. The ccpper should traverse the scoria in the metallic state.

2d. The iron, brought to the condition of protoxyd, ought to be combined to the siliea.

3d. The small quantity of sulphur remaining in the calcinnted matt should form a sulphuret of eopper.

The six tons of ore worked yield about 2,700 pounds of blaek copper, containing nhout niuety per cent. of copper. But it is necessary, always, to reckon that a small portion of this product—about an eighth—will remain in the condition of a rich matt, which we must repass to the calcination in kilns, and to the smelting for bluck copper.

Note.—In the first column of page 130, in our last issue, and the third line from the top, for "a *bundle* of wood" read "a *handle* of wood."

[To be Continued.]

[Written for the Mining and Scientific Press.]

THE AGE OF GOLD-BEARING ROOKS.

[By Thomas Rowlandson, Fellow of the Geological Society, London.]

NUMBER ONE.

INTRODUCTORY.

There cnn searcely be a doubt but that within a short period, more attention will be drawn to the subject which heads this and the sueceeding papers than has heretofore been the case, though probably far less so with those most interested (the mining community of California) than amongst European geologists, notwitbstanding it has a practical as well as a scientific interest. The views which the writer will hereafter lay before the readers of the Mining ann Scientifie Press are chiefly based upon conclueions, arrived at more than twenty yeare ago, after earefully gleaning from all available sources every partiele of information respecting the position of metallic veins relatively to the various strata which compose the crust of the earth, but more eepeeially those denominated auriferous and argentiferous. To the commeneement of the study of the latter described veins, I was induced, from a belief on my part that a careful examination of all the pheuomena attendant on their position and composition would probably be productive of information, calculated to elucidnte much whieh is at present obscure in physieal geology. It was not until after some years careful study of the subject that it became apparent that apart from the great theoretic interest eonneeted with the persuit, economie eonsiderations could be beneficially combined therewith, and led to a more striet exnmination of the varied combinations in which the precious metals are found in nature, and eventually to the introduction of improved modes of reduction of what are called refractory ores, which were perfectly successful. "Practice with Science" was the motto adopted, and in this individual instance, was unattended with failure. Wherever the latter occurs, it may, so fnr as metallurgy is concerned, be nlmost alwnys set down to a deficiency of one or the other elements here set forth so indispensably requisite to be in combination, in order to prodnce perfect success; for really there remains but a very small margin for invention or improvement, other than that pertainiug to a comprehensive and adaptive intellect, whieh, to a knowedge of what is already known, possesses the practieal nbility of applying the best, that is, the most economical and produetive methods for any speeial kind of ore under any and every given or altered circumstance.

Speculative seience and practical working are inseparably conneeted with mining and metallurgy, more so with the former than with the latter, yet the former is the one branch which is more particularly in arrenr of the science of the age. It was with such feelings that the writer commenced a series of papers under the above eaption which were published in the *Alta California*, the first number of whieh the snbjoined is in part a copy, appeared in that paper the 18th of August, 1863, commeneing with the following:

"The famous geologist, Sir Roderick Murchison, lays down in his different works as a prineiple that a eertain geological zone in the erust of the enrth is auriferous, gold he says, has never been found in any stratified formation eomposed of secondary or tertinry deposits, but only in crystalline rocks, or in the drifts from these rocks, whieh ie a tertiary aecumulntion of pliocene age. Usnally, the original position of the metal is in quartz or veinstone, that traverse nltered silurinu slates, frequently near their junetion with eruptive roeks."

This quotation was eut from the Europenn correspondence of a cotemporary, and ae it very fairly places the opiuions of the geologist alluded to not only as detailed in his published works, but as is known to the writer from repeated oral evidence, it may be well nt the present time to carefully examine how far these opinious are applieable to the conditions found on the entire Paeific Coast of Western America north and south. We believe it will be found on inquiry that the general fenturee—physical, geological, and ehemico-metallurgical—found in Califoruia and the contiguous Territories also pervade the entire regiou of Mexico, Central America, and the whole extent of the western coast of South Ameriea to Cape Horn, so far as auriferous and nrgeutiferons-benring rocks are concerned.

Perhaps we are not in a condition from the imperfect evidence hitherto obtnined of the age of the rocks in Califormia, to epeak very emphatieally on the point at issue. If, however, according to the general opinion, the roeks of tbe county of San Francisco, and the counties north, south and east of it, are properly classed amongst the latest tertinry or even quarterrary formations—of whieh Telegraph Hill may be taken ns a type—there is the strougest ground for believing lithologically, the only evidence so far attained thnt our gold-bearing rocke belong to very recent formatione. Prior to the writers' nrrival in California, this opinion had been nrrived at on theoretical grounds, not only as regards the continent of America, but also as respeete the Ural, Japan, Mnlaeea, Australin, Hindostnn &c., &c., and as far as his enquiries have gone, all the fncts ascertained tend to show that the conntries richest in the preeious metals are those whose area are chiefly formed of the later deposited rocke, intercalnted, metnmorphosed, and broken up by igneous ones.

The age of deposited rocks, whether the accumulation of drifted mud and sand, formed by the decomposition, destruction and removnl of roeks pre-existing; whether as aceumulated masses of chalk and limestone or the carboniferons series tbe age of all ie judged by the charncter of the organic remains found therein—animal, vegetable or both. Hitherto, the oldest evidenee found of this character, whieh is known to the writer, is a spirifer, found by W. Gabb, of the State Geological Survey. Thie mollusk has a wide range, being found in the silurian and carboniferous (*it might* have been added even to the jurassic). The probability is that the specimen found belonge to that clase of limestone, which wae and is still being uncovered by the placer mines around Sonora and Columhia, which may be as old ae the devonian or as recent as the carboniferons—*it might probably with considerable justice have been placed as high as the jurassic.*

At the moment of writing the above passage, whilst searching all availnble eourcee of information, the writer discovered that Mr. Wilson, in a communication made to the Geological Society of London, through Sir Roderick Murchison has stated thnt whilst working on the Stanislaus, and a little below Carson's and other rich creeks, where the elates running across the river were vertical, snys that while quarrying the hard slate rock, through which we hnd to cut our canal for the purpose of draining the river, we found a fossil hivalve shell resembling an orthis. (?) The position of the fossil (like that of the rock in which it was imbedded) was on edge, and tbe fossil

having been split through, together with its matrix, there remained a perfect impression on each piece of rock. The substance of the shell had become soft like chalk."

If the supposition previously named is correct that the specimen found was really an orthis, no room for doubt would be left for assigning the slates in which it was found to the palæozoic or oldest series of sedimentary rocks, and would confine the enquiry, though still a wide one, from the potsdam sandstone to the close of the carboniferous period. The note of interrogation inserted implies a doubt to which the writer is very strongly led to incline, for reasons which will appear hereafter. If, however, the opinion respecting its being an orthis is eventually found to be correct, it would place our gold-bearing strata in the same geological period as the auriferous rocks of Germany, Hungary, North and South Wales, Cumberland and Westmoreland, and would fully support the opinion set forth by Sir Roderick Murchison as quoted in the text. * * *

Although it should be eventually demonstrated that it is only in a certain zone of rocks (of Silurian age), that the successful exploration of auriferous and argentiferous veins is to be anticipated, that would by no means settle the point as to the time when these sources of the precious metals were brought to the earths' surface. Their position proves that whether called "injections" or deposits according as the theory of the person may incline to the igneous or aqueous theory of the origin of auriferous and other metallic veins, those metallic-bearing rocks known as veins and lodes, were formed after the deposit of the sedimentary strata inclosing them, the latter having been thrown from their probable formerly horizontal position into the more or less inclined one in which they are generally found to exist, by the same force and simultaneously with the injection and interculation of the mineral-bearing lode, usually accompanied by a large body of quartz. These views are in unison with the text, in which it is admitted that gold-bearing districts "are only found in tertiary accumulations of pliocene age." This view of the modern origin in geological time of gold and probably of all other metallic bearing lodes is greatly corroborated by a fact well known to Sir Roderick Marchison, that on Moel Tryfan a mountain in North Wales, and abuting on the northern extremity of the gold field of Merionethshire shells of an exceedingly modern date have been discovered in a deposit of clay at an elevation of 1500 feet above the present level of the sea, indicating an upheaval that must have taken place to that extent in recent geological time. These facts respecting the recent formation of natural veins as compared with the rocks which compose the stratified deposits in which are found such veins, are generally admitted, though the attempt to find the time at which the former occurred has occupied very little attention.

[To be Continued.]

AMMONIA IN FIRE.—An apothecary at Nantes has just discovered by the merest accident that ammonia will put out fires. He happened to have about seventy litres of benzine in his cellar, and his boy, on going down carelessly with a light, had set fire to it. Assistance was speedily at hand, and pail after pail of water was being poured into the cellar without producing any effect, when the apothecary himself took up a pail which was standing neglected in the corner, and emptied the contents into the cellar. To his astonishment the flames were quenched as if by magic, and upon examination he found that the pail, which belonged to his laboratory, had contained a quantity of liquid ammonia. The result is easy to explain on scientific principles; for ammonia, which consists of eighty-two parts of nitrogen and eighteen of hydrogen, is easily decomposed by heat, and the nitrogen thus set free in the midst of a conflagration must infallibly put out the flames. A large supply of liquid ammonia properly administered would be the promptest fire extinguisher ever imagined.

A HEARSE has just been completed in Philadelphia that may safely be asserted to be the most sumptuous affair of the kind in the United States. It was built to the order of a fashionable sexton in San Francisco. The vehicle, in the first place, is built upon an original model. The body, which measures seven feet on the inside, is oval in shape, constructed of plate glass, like two monster mirrors standing upon their sides, about five feet apart. The woodwork in which they are set, and which is the frame of the body, is in ebony and gold, every detail of the work being as perfect as in the most delicate ornament for the *etageres*.

AN establishment for the manufacture of silk cloths and threads has been erected in the State of New Jersey. It is to be supplied with operatives from France and was built by French residents of New York.

Geology and Mining.

Mr. H. Bergmann, in an article in the London *Mining Journal*, in discussing the causes of igneous action, says:

As my object here is to deal with the theoretical principles of geology, only in so far as they may be absolutely necessary to my subject, it would be simply sufficient for me to establish the fact that granite and the trappean rocks owe their origin to igneous action, without at all entering into the far deeper and more complicated question of the *source and causes* of this action; for, while all geologists are now unanimously agreed on this first point, a great difference of opinion still exists on the second. These differences, which involve theoretical considerations of the highest importance, are not in any way connected with the practical questions I am about to discuss; still I deem it necessary briefly to refer to them here, in order to clear my subsequent way, by removing some misapprehensions which I know from experience to exist.

There are two hypotheses on this subject, both maintained by men of the greatest eminence in science. The one, however, which is the most popular is that which assumes our whole planet to have been originally in a state of igneous fusion. From the cooling of this mass by the radiation of the heat into space, a solid crust is supposed to have been formed, which has gone on gradually increasing in thickness as the original heat becomes dissipated. This hypothesis assumes "that all the great outbursts of igneous matter, by which the crust has been penetrated and its surface diversified"—that is, all past and present igneous or volcanic action—were and are "merely outward signs of the continued internal activity of that primordial heat," which is so far from being yet exhausted that it is still sufficient to maintain a great portion of the center of our earth in its original fluid state.

The other hypothesis—which is principally supported by Sir Charles Lyell, who considers that "to suppose the entire globe to be in a state of igneous fusion is to introduce a force altogether disproportionate to the effects which it is required to explain"—denies that the igneous rocks are attributable to any primeval molten matter; it, on the contrary, assumes them to be *derivative igneous rocks*—that is, rocks derived from the fusion of deep lying stratified masses, which "local varintions of temperature" have melted one after another under every part of the earth's crust, and which have there produced "lakes or seas of melted matter." The beat to which these "local variations of temperature" is due is not attributed to original central heat, but is referred to the general effect of chemical and electric action constantly going on in the earth's crust.

Such are the leading hypotheses respecting the causes of igneous action, by which the reader will at once see that the acceptance of the doctrine of the igneous origin of granite and trap by no means involves an acceptance of the hypothesis of the igneous origin of the globe, and the present fluidity of the interior. If he object to that most popular hypothesis, he may accept Sir Charles Lyell's, or may suspend his judgment on the subject entirely. It only concerns me at present that all seasible men—men who desire to apply the *overflowings* of geology to mining—should accept the fact upon which all progress must be founded—the undoubted truth that the trap rocks and granite have once been in a molten state; they may be assured it is a fact beyond all reasonable doubt—a truth which the experience of every day strengthens.

The leading doctrines of modern geology are very few and simple. All the stratified rocks which we observe at or near the surface of the earth, and they compose the greater part of it, were originally formed at the bottoms of seas or lakes, mechanically deposited as mud or sand, or chemically precipitated in various forms. These deposits were always laid down in beds more or less approaching to horizontality, and they have since been uplifted from the depths where they were first formed into the undulating plains and contorted mountains by which the surface of the earth is now varied. Mind, the land was raised, not the sea lowered; for nothing is better established than that during all geological time, cognizable to our examination, the level of the ocean has changed little, if at all.

These stratified rocks have been ruptured and penetrated throughout their whole series by various rocks of igneous origin: by volcanic or trap rocks, which were forced up through, or near to, the surface either on the land or under the water; or by granitic rocks, which, although originally consolidated deep in the earth's bosom, were subsequently elevated, and their covering removed by the effects of denudation acting through countless ages.

These two classes of rocks would at all times be readily distinguishable from each other, if we did not frequently find another class, partaking alike of the character of each of the others, and forming that transition between them which we find everywhere in nature. There are rocks to which geologists have agreed to give the name *metamorphic*, they having been produced by a metamorphism, or *alteration*, of the sedimentary strata by various causes—principally, it is supposed, those of heat and pressure.

I shall refer to some of the leading features in these rocks, in order that I may dwell more particularly on the causes to which their alteration is due, as it appears to me that it is to these causes we must almost entirely attribute the phenomena bearing on mineral veins.

METAMORPHIC ACTION.—Scarcely one rock mass throughout the whole range of geology can come under examination without our finding some kind of structure which, on careful consideration, we must see could not have existed at the time of its original formation. When chalk was first deposited, it is quite evident that it did not contain the flints with which some parts of it now abound. The aggregations of carbonate of iron which are found so plentifully in many rocks, have, undoubtedly, been accumulated since the formation of those rocks. The older clay slates were clearly not deposited originally at the bottom of the sea, in the hard, compact form in which we now see them. The extensive veins of quartz, carbonate of lime, carbonate of magnesia, which we find in rocks of various classes, are long subsequent in formation to those rocks themselves. Again, we can find no rock mass that is not more or less divided by a regular and parallel structure, extending in many cases to a structure called cleavage, by which we mean a tendency in rocks to split into thin parallel plates, in a given direction, extending over wide areas, independently of their stratified lamination. Both joints and cleavage are palpably due to some action that has taken place since the consolidation of the rocks affected by them.

All these peculiarities of contents and structure we know, on the slightest consideration, must have been produced in rocks since their formation. But there is another class of rocks, the metamorphic origin of which is not at first sight so evident, but which we can yet prove, by direct observation, to have had that origin. This class includes many of the so-called primary rocks which the old geologists supposed to have been precipitated in the crystalline state in which we now find them. It is one of the greatest steps of modern geology to have proved that these rocks were deposited originally in the form of sand, mud, or chalk, just as such substances are now deposited under water, and to have been since metamorphosed, or altered, to their present condition by various causes. This is the case with most of the gneiss and mica schist rocks, quartz rocks, and primary limestones which have been distinctly proved to be merely the altered form of common schistose, quartzose, and calcareous beds. I extract a short passage from Sir R. Murchison's *Siluria* respecting these rocks, and the proofs of their alteration:

"We now know that a great portion of the micaceous schists, chloritic and quartzose rocks, clay-slates and limestones, once called primary, were of later origin. Many of these were nothing more than subaqueous sediments of various epochs, which have been altered and crystallized at periods long subsequent to their accumulation. This inference has been deduced from positive observation. Rocks, for example, have been tracked from the districts where they are crystalline to spots where the mechanical and subaqueous origin of the beds is obvious, and from the latter to localities where the same strata are wholly unchanged, and contain organic remains. Transitions are thus seen from compact quartz rock, in which the grains of silica are scarcely discoverable with a powerful lens, to strata in which the sand, gritty and pebbly particles bespeak clearly that the whole range was originally accumulated under water. Other passages occur from crystalline, chloritic and micaceous schists to those clay-slates which are little more than consolidated mud, and from crystalline marble to common earthy limestone, in which organic remains abound."

The term "metamorphism" was originally applied only to the latter class of rocks referred to—that is, those in which the process of alteration has been carried so far as to obliterate the original structure; but lately the meaning of the word has been more extended, and it is now used to indicate all alteration, however trifling, and from whatever causes, that has taken place in rocks from the time of their first accumulation. In using the word metamorphism, however, in this large sense, we must remember that the term *metamorphic rock* is still limited to its original significance—that is, to works where the action of metamorphism has been carried so far as to obliterate the original structure, and give rise to a new one.

The causes to which this metamorphic action is due are among the most complicated questions in the whole range of geology, and particularly when we use the word metamorphism in the wide sense I have done; for it is quite evident that the causes which have resulted in the alteration of schist into gneiss, and chalk into crystalline statuary marble, which have produced the joints and cleavage of rocks, which have given rise to the aggregation of flints, ironstone and septaria, and to which we owe the great veins of calcareous and quartzose matter with which extensive masses of rocks are penetrated, are manifold complicated causes, and require the most minute and careful investigation.

This examination they have yet far from received, but, as far as our knowledge goes, the following are now held to be the principal causes of alteration in rock masses:

1. Heat, either simply or as producing chemical and electric action.

2. Heat and moisture, either simply or as producing chemical and electric action.

3. Compression.

4. The continued percolation of water through the whole surface of the earth. No point of the surface within the reach of man can be penetrated, and no rock, however compact, can be broken which will not be found to contain water holding some other substances in solution—often silicic or carbonic acids. It is now fast being recognized that it is to this never-ceasing passage of water through the crust of our globe, that the principal minor effects of metamorphism are due, such as the formation of quartz veins, etc.

WHAT IS ALL THIS WORLD?—Have we not all of us been out in what we call the World? Who is it that has not said, in rambling in idleness and want, "What is all this world?" Who has not stood, and in utter weariness, looked, and gazed, and longed for something—for some pastime—for, in fact, something to do? There are ten thousand people on the streets. They are standing and stopping, and wishing and hoping, and as they pause, looking not up to those glorious stars which are free to the gaze of all, not upon the bright prospect of realizing what they had pictured in their fancy, but standing upon the corner, have dropped in utmost despondency, and said, "What is all this world?" This is a great center—a great point of concentration of everything—of everything practical and substantial; but with all that which is material, there is something else. There is some heart—there is an ideal life which speaks only to the ideal—which talks only to the heart through the soft sense of perception. Look at the vast throng who walk and wait and wander on these busy thoroughfares. They have come for adventure, for change, for chance; and their object is to be discerned in every feature. We see them, and wonder what their thought may be, and we find that they are merely saying to themselves: "What is all this world?" Sad indeed is this contemplation of the hosts of people who pass us daily. Oh, that we could lift up, our poor struggling fellows, who behold the times as a waste, dreary and dark—who perceive no day; who gaze into life as though it were a deep night, starless and black, and say, "what is all this world?"

Let the gloomy look for sunshine in Hope. This is a consolation which any one can give; but this is the center of changes, of advancements, of adventure, of inventions and of successes. There is a strong and ever-pulsating heart of progress here, and at every throb it is telling for improvement in all its relations, and there is no man who will suffer immediately from its action. Let us gather brightness from the scene, however dreary; and though we may stand and think to ask, "What is all this world?"—ask it not, and be awake to take the future, as having in it a value which we all may use.—*S. F. Flag.*

SHIPMENTS OF BULLION.—The Virginia papers chronicle shipments of bullion from Reese River to the amount of from $15,000 to $20,000 per week. The shipments of bullion from this city are slowly increasing, but are still much less than they ought to be, to render us a self-supporting community. The population of the county is probably about seven thousand, and the necessary importations to supply that number, and enable them to carry on their business, must be near one dollar per day, or say in the aggregate $5,000 each day, or $35,000 per week—$1,820,000 per annum. Our exports of bullion for the past year was about $500,000, showing a balance against us of over $1,300,000 in current expenses. For this we have, besides our production of bullion, some five hundred new buildings, mostly made of home material, much stock, farming and mining improvements, the value of which cannot be estimated, and some five or six new mills, and vast improvements on others. The mill, and other building material imported during the past year, will probably equal the entire amount of silver product. It appears then that to carry on our business with our present population and continue our improvements, we shall be required to produce about $2,500,000 annually of consumable or exportable articles. Our articles of export can only be from our mines, and until they equal our imports we cannot be considered as a prosperous people.—*Reveille, 31st ult.*

THE foundation of a Catholic Orphan Asylum has been laid in Grass Valley.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

San Francisco, Saturday Morning, March 11, 1865.

Great ease prevails in the money market. The demand for regular business purposes is very small, and the speculative demand exhibits no unusual feature. Mining share collaterals are in rather more favor in bank circles, but cash requirements, resulting from operations in these securities, seem to exert a slight influence, at present, upon the general market. The rate of discount in Bank is 1¼@1½ per cent. per month.

Receipts of Treasure during the past week amounted to about $1,900,000. The market is well supplied with Bullion, and a fair demand has prevailed for shipment to Oriental ports. Gold bars are ruling at 850@860, and silver in round lots at 2 per cent. discount to 2½ per cent. premium.

The stock market has attracted more attention than at any time since the opening of the year, and very large transactions took place in nearly all shares, at enhanced rates. The present excitement upon the Stock Exchange and the extraordinary advance in a few leading claims have been occasioned by the very favorable developments made in these mines recently, and to large Eastern orders. This latter interest has become quite a feature of the market, and a larger business may be anticipated for Wall street account the ensuing Spring and Summer. The discouraging views entertained by some, a short time since, as to the waning productiveness of the Comstock lode, were not, it would now seem, based upon sound premises, if its present appearance in certain localities affords any evidence of intrinsic value or future permanency.

A speculative demand has occurred for a number of fancy stocks, many of which advanced materially. The excitement and activity in other shares gives a certain impulse to this movement.

City stocks continue to be well held at current quotations. California Steam Navigation is offered at about 80 per cent. The regular monthly dividend of 2 per cent. on the capital stock will be declared. This Company have accumulated a surplus fund of $470,000, if we are correctly informed, and without opposition from any quarter, will continue to largely increase their net earnings.

San Francisco Gas is held at 85. It is said that negotiations have been pending for a few weeks past to consolidate the Citizens Gas with this Company and that terms are likely to be agreed upon. The Citizens Gas Company have expended some $400,000 thus far, and it is understood exact a handsome bonus for their franchise and improvements. The Legislature did not probably contemplate an abandonment or sale of this enterprise when the charter was granted to the Company.

Pacific Insurance Company has advanced to $144 bid, (44 per cent. premium,) and is strongly held. In addition to the regular quarterly dividends of $6 per share, an extra dividend is likely to be declared a few months hence out of the large surplus in the treasury of this Company.

Legal Tender Notes rose from 50¾c to 53½c, and closed at 54c bid, 54¼c asked. More than $200,000 were sold. Latest telegraphic advices from the East quote Gold at about 194.

Yellow Jacket has maintained its supremacy, rapidly advancing from $1,960, ex-dividend, to $2,500, receding to $2,400, and closing at $2,350; 71 feet were dealt in. An average of 300 tons of ore are now daily hoisted to the surface from this mine, about 15 tons of which pay some $300 per ton and the balance about $50. The pay vein is at present 450 feet in length, at a depth of 340 feet, and the portion prospected, some 30 feet in width. Recent developments in the 360 feet level are said to be even more promising than anything yet found above. Receipts of Bullion from this claim for the first week of March amounted to $75,000, and for the entire month will probably reach $300,000.

Gould & Curry is also in better favor, and advanced from $1,720, ex-dividend, to $1,910, closing yesterday afternoon at $1,960. Within this range 42 feet were sold, most of which was bought for New York account. There is no material change to note in this mine. The Company have a handsome reserve of ore on hand, and about the usual quantity is being reduced. The Mill is working admirably and is now thought to be as perfect an establishment of the kind, in all respects, as can be found on the coast.

Savage has been actively dealt in at an important advance over rates ruling last week, and 69 feet were sold, rising from $1,510, ex-dividend, to $1,810 per foot, closing at $1,805. In what is known as the North Potosi chamber a body of rich ore 20 feet long and wide and 50 feet in depth has been disclosed. One-third of this ore is said to be first class, and will be sacked for shipment to Europe, and the remainder, worth some $300 per ton, is being sent to the Central Mill. Other portions of the mine are also yielding well, from which the ore is averaging about $50 per ton.

Belcher has likewise been in decided favor, advancing from $1,250, ex-dividend, to $1,600@$1,625, at which latter rates small sales were made. From this mine 1,535 tons of ore were crushed in December, averaging $60 per ton, 1,849 tons in January, averaging $73, and some 1,400 tons in February, which yielded an average of $68. In all, for the past three months, 4,783 tons produced about $310,000—an average of some $65 per ton. The prospects of the company were never more flattering.

Crown Point rose from $1,200 to $1,450, and closed at $1,350 bid, $1,400 asked, 32 feet have changed hands. The vein at the 230 feet level has been traced a length of 220 feet and is thought to contain good ore throughout the entire distance.

Potosi is in better request and 55 feet were sold, rising from $740 to $880 per foot, and closing at $885. Receipts of bullion from this claim for the month of February amounted to $168,000. Some 2,400 tons of ore are now on hand at the different mills and on the dump at the mine. The company are sinking 500 feet south of the main shaft to a depth of 484 feet and propose to run north and communicate with a drift at that level running south from the shaft.

Chollar has been an exception to the advance in nearly all other stocks and 198 feet were sold at rates fluctuating between $640@$550, and closing at $585. The ores taken from the upper stopes in the fourth level of the south mine, have not yielded well recently. When the lode is reached at a greater depth by means of a drift from the main shaft, it is believed that more remunerative ore will be found. The suit of this company *vs.* the Potosi, to determine whether the former decision of the Supreme Court of Nevada is a bar to any future litigation, will be heard on the 25th inst.

Ophir is in better favor and advanced from $380 to $450, closing yesterday at $440. In all 68 feet were sold. We learn of no new developments. The pump in the central shaft has not yet reduced the water below 100 feet, at about which depth it has remained for months past. An accident this week to the engine has caused a temporary suspension of work in the Mexican shaft. The suit of the Burning Moscow *vs.* the Ophir is expected to be tried in a few days. Hale & Norcross rose from $240 to $360, receded to $340, and closed at $330.

Uncle Sam was very actively dealt in, and 191 shares changed hands within a range of $330@$420 per share; closing at $370. Overman has improved materially and 40 feet were sold, advancing from $250 to $350. Imperial rose from $152 to $160 per share, receded to $142, and sold yesterday at $145@$146.

Empire Mill & Mining Company was sold at $500 per share. Work in this mine has been suspended for the present in consequence of the recent cave. The accident having thrown the engine and machinery out of gear and unsettling the ground in the vicinity very much, it will probably require a month to re-arrange matters and to enable the company to resume work.

Burning Moscow has vibrated but little and 500 shares were sold within a range of $52@$39. North American rose from $31 to $44 and closed at $88 bid. Bullion declined from $120 to $115. Sierra Nevada rose from $15 to $25, an assessment of $5 delinquent, closing at $22. Lady Bryan rose from $9 to $13, and closed at about $12. Nevada, (J. G.) was sold at $30. Caledonia Tunnel at from $10 to $13. Burnside at $7. Daney at $26 to $47½ and Pride of the West at $8½. Wide West rose from $11 to $15, and fell to $14. Buckeye rose from $6 to $15 and closed at $11.

The aggregate sales of Stocks and Legal Tender Notes this week amounted to $858,566.

Commissions on Mining Shares.

Sale at 1 dollar up to 10 dollars per foot	$0 25 per foot
Sale at 10 dollars up to 25 dollars	50 per foot
Sale at 25 dollars up to 50 dollars	1 00 per foot
Sale at 50 dollars up to 100 dollars	1 50 per foot
Sale at 100 dollars up to 200 dollars	2 50 per foot
Sale at 200 dollars up to 400 dollars	5 00 per foot
Sale at 400 dollars up to 600 dollars	6 00 per foot
Sale at 600 dollars up to 800 dollars	7 50 per foot

From $800 to $3,000 per foot, one per cent, on the amount of purchase or sale.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

FRANK LAWTON, Secretary.

J. B. E. CAVALLIER, President.

Mechanical.

THE STEAM ENGINE.—A week or two since we made some allusion to an improvement in the steam engine recently invented by a mechanic at Los Angeles. The *Star* of the 22d ult. gives the following further notice of that invention:

Its motion is always the same, whether running at fast or slow rates of speed; the jar, or racking unsteadiness common to all steam engines now in use is entirely overcome—done away with—in consequence of which the new invention must take precedence over all the motive power for manufacturing purposes; for cotton, woolen and other factories where a gemination of speed is required—which is usually obtained by cumbersome driving, or balance-wheels—expensive, and to operatives, dangerous "belting." It is particularly adapted for a short and powerful stroke, as either steam, hot or compressed air, or water, in very large volume may be used; it may be constructed of any size desired without over reaching the designs of the inventor, whose aim has been to give it utility, speed and safety over all others. In all cases—with its use with steam, etc.—there can be no back pressure, as the cylinders are open at every stroke—one cylinder discharges while the other cylinder receives the steam—thus hursting and collapse is rendered impossible under all circumstances; the pistou-packing is discarded entirely, and the simplicity of construction will afford a complete engine for hundreds of dollars, where it costs thousands for those now used; instead of being "cylindric" the material used is chiefly straight "slabs." In this engine we have that which has been so long needed—a means of working drills in deep mines. Hear what the *Scientific American*, of January 14th, says of the invention above mentioned:

"This invention consists in an engine with two pistons, which work in square cylinders, and are connected by a rigid bar carrying two studs, in combination with a lever secured to the end of an oscillating shaft on which is mounted a cog-wheel or pinion gearing in toothed racks, attached to or cast solid with the two slide valves, in such a manner that by the action of the oscillating lever the valves are changed at the proper intervals, and one cylinder takes steam while the other exhausts, and by these means a constant reciprocating motion is affected by the action of steam, hot air or water."

A NEW ERA in the manufacture of paper appears to be slowly dawning upon us. Recent experiments in Austria have shown that Indian corn husks are but little inferior to linen for this manufacture. The latest advices from the East states that the publishers of some of the leading journals there have secured the control of the new discovery, so far as the same is applicable to the manufacture of printing paper, and they respectfully invite proposals from every town, county and State in the United States for supplying clean, sound and well-dried husks, the same as are stripped from the ripe corn. The husks to be baled in even hundreds of pounds, and delivered at railroad stations.

USEFUL INVENTION.—The Nevada *Transcript*, of the 26th ult., speaks of a new contrivance for supporting wagon-tongues, which we should think might prove quite useful. It consists of a spring attached to the front axle and extending along the pole. At the outer end it curves upward and a wheel rests upon a curved iron bar. The tongue is fastened with a bolt, and the spring gives as the wagon jolts over a rough road. The object of the invention is to avoid the injuring of horses, which results from the jerking of the breast chains or else the rubbing of the pole. Teamsters who have examined it, pronounce it an excellent improvement.

IMPROVEMENTS IN PHOTOGRAPHY.—Among the recent improvements in the art of photography is that of photographing on porcelain. The effect is quite pleasing, the picture being clear and distinct like fine line engraving, and especially beautiful when suspended where the light can pass through the porcelain, which renders the shading soft and delicate, and brings out many effects which cannot be produced in any ordinary picture.

AMONG the improvements carried on at Aspinwall is the construction of three fine new wharves, built on iron piles, two of which are for the Railroad Company, and one for the Royal W. I. Mail Packet Company. The latter will be upwards of 400 feet in length.

A SCREECHER.—They have set up a twelve-inch steam-whistle at the Manchester (N. H.) Locomotive Works, which it is said can be heard ten miles, and has a very decided effect on sleepers in the morning.

THE PIONEER FURNACE in Alpine county was completed on the 25th ult. This furnace, says the Markleeville *Chronicle*, has been erected at the Pioneer Mill for the working of ores by the "Rivot Process." The work has progressed under the careful supervision of M. Maize, of San Francisco, and for architectural beauty and workmanship reflects great credit on him as a master mechanic. The extreme cold weather we have lately experienced has been a great drawback in the erection of the furnace, preventing them going to work until at a late hour in the morning, and compelling the proprietors to keep large fires burning night and day to keep the mortar from freezing. For the purpose of drying it, a fire was started in the furnace this morning. M. Coignet, who tested the Morning Star rock at the Brunswick Mill, by the above-mentioned process, last Fall, arrived here last evening for the purpose of superintending the first working of the furnace, which will probably be ready on next Wednesday to commence work, so in our next issue we hope to be able to chronicle the birth of a veritable "silver brick," the product of our own native mountains. Should this furnace prove a success, of which there can hardly be a doubt, Wade, Schetter & Jones, to whose enterprise our county is greatly indebted, will in due time erect several more of a greater capacity.

NOVEL AND SIMPLE GUN CLEANER.—Mr. I. W. Parmenter, of New York City, recently brought to the office of the *American Agriculturist* a simple and efficient gun cleaner, that he had been using in lack of tow, which he could not readily obtain, and to which it proved superior. A bit of corn cob about three inches long was whittled down small enough to enter the barrel readily, but not so much as to entirely cut off the rough projections—these serve admirably to scour the interior of the barrel. The lower end of the cob was split up about an inch, and the two halves were kept sprung apart to fill the bore, by a small wedge across the upper end of the opening. The interstices on the service of the cob may by filled with ashes, emery, powder, or other scouring material, to remove rust, etc. The cob so prepared and screwed to the wormer of the ramrod was used as a swab, and in a very short time the gun was thoroughly cleaned. This is not patented.

A FIRM at the Mission Dolores, San Francisco, have recently commenced the manufacture of channel-nailed boots and shoes for ladies and children. The soles look like sewed work, but they are in reality riveted to the uppers by nails, which are driven by hand on an iron-plated last. This clinches the nail, and renders separation from the uppers almost impossible. The surface of the sole where the nails are to be driven is first cut up with a knife; then the nails are driven and the leather smoothed and hammered down again. The nails are thus completely covered from view. The sewing of the uppers is done on a sewing machine. This company have the only machine for hardening sole leather in San Francisco, and a patent eyelet machine which feeds itself. It is very useful, and is worked by a treadle with great rapidity.

A NEW PREPARATION OF PAPER.—Several preparations of paper have lately been made which promise to drive iron out of use for plating ships of war; but the last announced is the most remarkable. Very thin sheets are dipped in the oriental gum, called zopissa, and then put together. Plates of this paper, an inch thick, are bullet proof, impervious to water, indestructible by insects incombustible, and have the advantage of being lighter than any known substance possessing these qualities.

MARBLE CEMENT.—The *Scientific American* says that a very fine marble cement is made by soaking plaster of Paris in a strong solution of alum, after which it is baked in an oven and then ground to powder. The powder is then mixed with water and applied as wanted. It acts very hard and takes a brilliant polish. It may be mixed with metallic colors, such as red lead, so as to produce an imitation of marble.

SAFETY COUPLINGS FOR CARS.—The London *Artisan* for January has an illustrated description of recent methods of couplings, patented by Mr. Chamberlayne. The most noticeable of them is, the substitution of a chain for the coupling link, so arranged that one car may hold up the end of another in case of breakage of running gear.

EXTRA HARD STEEL.—Mr. R. Mushet writes to the *Mechanics' Magazine* that he can produce steel so hard that it will bore the hardest rocks, and when boring ordinary rocks will be almost imperishable in its edge. In limestone a nine-feet shaft costs $30 per fathom; and in hard capel or roskear stone it costs $300 per fathom; with the improved steel he thinks the cost in the hardest stone will not be more than it now is in the softest.

Leathern Artillery.

The field pieces of a former age were machines of iron or brass, immensely cumbrous and almost unmanageable. The problem to be solved was, how to render a gun more portable without lessening its projectile force. After full consideration of the matter, Robert Scott came to the conclusion that there was "nothing like leather." Of hardened leather, therefore, he constructed guns. The correctness of his idea was tested by experiment, and the result was considered to show the immeasurable superiority of leather over brass and iron. Why he did not lay the invention at the feet of his own liege sovereign, it is needless to inquire. Perhaps he did so and was snubbed for his pains, as other inventors have been since his time. At all events, he raised a company of 200 men and went over to Sweden, where he was welcomed by Gustavus Adolphus, who, seeing his ability, and the value of his discovery, forthwith took him into his service, and at the end of two years, rewarded him with the office of Quartermaster General of the army.

After five years' service under Gustavus, he repaired to Denmark, where he was appointed General of the King's Artillery; but soon afterwards yielding to the advice of friends, he returned to England, and tendered his services to his own sovereign, King Charles I. This step, which was taken in 1729, turned out a very profitable one for the Colonel. He was received with open arms by Charles, who appointed him one of the gentlemen of his privy chamber, granted him an annual pension of £600 out of the Court of Wards, and purchased for him a house in Lambeth at a cost of £1,000. Colonel Scott, however, did not live long to enjoy these tokens of the royal favor; for, dying in 1731, he was buried in Lambeth church, where a sumptuous monument, still to be seen, was erected to his memory by his loving wife Anne, whom he married in France. The sculptor has represented the Colonel as an armor-clad, fierce-looking man, wearing a heavy mustache and a pointed beard.

In the very year of the Colonel's death, Gustavus Adolphus had an ample proof of the effectiveness and utility of the leathern artillery at the battle of Leipsic. The guns were found to be so easily portable that a small battery could easily be removed from one part of the field to another, or a new battery was made in the space of ten minutes; and when a fresh attack was about to be made on the part of the enemy, a battery was immediately at hand to repel it. In fact it was in a great measure owing to the invention of Col. Scott that the Swedish King obtained so glorious a victory; and the Imperial General Tilly himself was constrained to admit that the portable cannon performed wonders. How it came about that the leathern ordnance was shortly laid aside as worthless, is difficult to explain, or even conjecture; but it is not recorded to have made any subsequent appearance on the battle-field, though a leathern cannon was fired in Edinburgh so late as the year 1788—probably out of curiosity.

IRON-CLAD HOUSES.—They construct corrugated iron houses in New York. The material used is a thin plate of iron, corrugated by the rapid action of a machine, and two of these separated by intervening joints and filled with cement or concrete, form a single wall of any desired thickness. Thus forming an iron-clad house.

THE INTERNAL REVENUE TAXES are making some important developments with regard to the distribution of wealth in the country. Among other things, we notice the following with regard to the proportion of wealth as distributed among several of the States:—

New York we should expect to exhibit the highest ratio, yet its twenty-four millions of taxes divided among its population of nearly four millions, gives a tax of only $6 to each individual. Pennsylvania, with nearly thirteen millions taxes, divided among about three millions of population, gives but $4.46 to each person. Massachusetts gives $9.07; Rhode Island, $10.25; Connecticut, $6.34; Ohio, $5.04; Illinois, $5.70; New Jersey, $4.32; California, $4.50; Maine, $1.80; Michigan, $1.57; New Hampshire, $3.07; Vermont, $1.12; Delaware, $3.23; Maryland, $4.02; Indiana, $2.41. According to these ratios, Rhode Island is richer, *per capita*, than any other State in the Union; or in other words, capital is more remunerative and wealth more accumulated. California, it will be seen, makes a fair exhibit as compared with several of the larger and oldest of the Atlantic States.

SEVERE.—The Grass Valley foundry, owned by Mr. Taylor, was destroyed by fire on Saturday morning last. The fire is attributed to incendiarism. The foundry will soon be rebuilt, notwithstanding another and rival foundry is already projected.

Mr. Million Dollars.

The following from the address of Henry Ward Beecher at the recent meeting of the Tract Society in Boston, is characteristic and pertinent:

A man may make a million dollars and be—a man. For a man who has got a million dollars, you know, *is* a man—in New York, and I suppose, in Boston. Everybody takes his hat off to Mr. Million Dollars. He is conciliated, he is respected; and if there is any prospect that the dew will be shaken off his branches he is invited everywhere. If a man has a million dollars, he is a man; but he dies, and his million dollars is cut into four quarters, and four persons carry it off their several ways. Mr. Million Dollars, after an appropriate funeral, is buried, and there he lies; and in a few years nobody talks about him, nobody thinks about him, nobody hears about him. In fifty years the shrewdest man might go and read his gravestone and find "Mr. Million Dollars." "Who was he and where is his money?" And it would puzzle an antiquary to tell what those heirs did do with it. It puzzled them after a few years to tell where it had gone to. He made his money; it gave him power and influence; he distributed it among his heirs, yes, he distributed it, and they squandered it; he died and went to dust, and that was the last of him, so far as this world is concerned; I don't know what became of him beyond.

But suppose that instead of that he had made himself his own executor, and had put $50,000 behind a printing-press and said, "As long as interest lasts on that $50,000, work, press, work!" Suppose he had taken some treatise written for liberty, based upon the Bible, and carrying out the vital power of the gospel, and put into the hands of the Tract Society, saying, "I consecrate to the printing of that book this $50,000; work with that money as long as it can bear interest." Suppose he had taken $500,000 and appointed them his sentinels—stationing $50,000 there, and there, and there—they would go on working until the last trump sounds; and when a hundred years had passed over his grave his name, through that society, would still be fresh, and his influence potent for good. Every tract would bear his name upon its imprint, and a million tombstones could not make it so illustrious.

INSECT MUSIC.—Buffon, Oliver Goldsmith, and others, tell us that flying insects, like mosquitos, locusts, and so on, make the humming noise they do by beating the air with their wings. It is a mistake. They sing just like ourselves, only their vocal organs are deposited not in their throats, but along the sides of their bodies. They use (so the microscope assures us) a windpipe, the outlet to which is furnished with a vibrating valve like that employed on the accordeon; but then a man has only one of these arrangements, while most insects have at least a dozen; and through each of the dozen, as they fly, the air is made to rush with prodigious effect, and some degree of melody. After all, then, the locust and the mosquito are musicians, and carry about with them under their wings, a full orchestra of wind instruments, wherewith to serenade their loves, and play harcarolles until "daylight does return."

TIMBER LANDS ON THE PACIFIC.—A correspondent of the Sacramento *Union* says the General Land Office is very much annoyed at the repeated complaints made concerning the wholesale destruction of timber by unauthorized parties in California and Nevada. It is not intended to restrict miners and actual settlers from using timber on unoccupied public lands for mining and domestic purposes, but the wanton waste of timber, so long a crying evil in California, must and will be stopped. Existing laws being susceptible of abuse by the officers as well as by citizens, Senator Conness has in preparation a bill to guard against the cutting and deportation of timber, but securing to the miner and the agriculturist his right. Meantime, lumbermen in Nevada are required to pay to the Government one-sixth of their profits for the use of Government timber.

MINING IN OREGON.—From every mining camp in Southern Oregon, says the Jacksonville *Sentinel*, comes cheering, golden news. Water is abundant, and all hands are at work. Take the mines in the aggregate, and they will yield, this Winter, at least five dollars per day to the man. There are at the present time, exclusive of Chinamen and Kanakas, from five to eight hundred men employed in the mines of this county. There are probably a thousand Chinamen. The flood did the miners much injury in carrying away flumes and reservoirs, but there was a compensation attending that injury. Accumulated deposits of tailings were swept away, and old channels cleaned out to the bed rock.

THE new works of the Gould & Curry Company, on D street, Virginia City, narrowly escaped destruction by fire on the 3d inst.

Early Description of Oil Springs.

The following passage, copied from the *Massachusetts Magazine* for July, 1791, may interest those who have struck, or are expecting to strike oil:

In the northern parts of Pennsylvania there is a creek called Oil creek, which empties itself into the Alleghany river, issuing from a spring on the top of which floats an oil similar to what is called Barbadoes tar, and from which may be collected by one man several gallons in a day. The American troops, in marching that way, halted at the spring, collected the oil and bathed their joints with it. This gave them great relief, and freed them immediately from the rheumatic complaints, with which many of them were affected. The troops drank freely of the waters; they operated as a gentle purge.

There is another spring in the western parts of Virginia, as extraordinary in its kind as the one just mentioned, called the Burning Spring. It was known a long time to the hunters. They frequently encamped by it for the sake of obtaining good water. Some of them arrived late one night, and after making a fire, took a brand to light them to the spring. On their coming to it some fire dropped from the brand, and in an instant the water was in a flame and so continued, over which they could roast their meat as soon as by the greatest fire. It was left in this situation, and continued burning for three months without intermission. The fire was extinguished by excluding the air from it or smothering it. The water taken from it into a vessel will not burn. This shows that the fire is occasioned by nothing more than a vapor that ascends from the water.

There are two springs high up on the Potomac, one of which has about the same degree of heat as blood running from the veins. It is much frequented by people who have lost their health. The waters are drank with freedom, and also serve as a hot bath, by which much good has been experienced. The other spring, issuing from the same mountain, a little farther off, is as remarkable for its coldness as the other for its heat, and differs from common springs in as many degrees.

MECHANICS' INSTITUTE ELECTION.—The annual election for officers of the Mechanics' Institute took place on Tuesday last. There were two tickets in the field, known as the "Regular" and "Opposition." Four hundred and seventy-eight votes were cast, against one hundred and fifty at the election last year. The election resulted in favor of the "Regular" ticket. The balloting was as follows:

	Regular	*Opposition.*
PRESIDENT:		
Charles M. Plum	262	Cyrus Palmer	206
VICE-PRESIDENT:		
Josiah Moulton	251	W. T. Garratt	218
RECORDING SECRETARY:		
P. B. Dexter	314	Jacob F. Miller	166
CORRESPONDING SECRETARY:		
C. S. Higgings	267	A. T. Dewey	200
TREASURER:		
Edward Nunan	246	John Archbald.	224
DIRECTORS:		
A. A. Snyder	268	H. T. Graves	216
H. K. Cummings	266	J. B. Johnson	203
W. W. Hanscom	268	George T. Bohen	195
James R. Deane	251	W. P. Harrison	202
David Dwyer	269	Jonathan Kittredge	206
D. A. McDonald	273	James Macken	204
J. W. Reay	255	Cornelius O'Connor	195

THE COST OF ROYALTY.—The Prince of Wales' yearly allowance is fixed at £50,000. In our currency this would be something like $600,000, on which the young man ought to support himself and family, even with flour at $16 per barrel; but it appears he thinks differently, as he has asked Parliament for an increased allowance. In addition to his regular allowance, he has also a large income from his private estate.

Mining and Scientific Press Patent Agency.

SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through a staff of our agents there in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The object of the maker of a caveat is, that the caveator be there to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is retained, viz: twenty dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted, no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as briefly as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The agency adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have reported cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & CO., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way is to remit by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stereotype, borders, etc., and all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-reliefs, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 y'rs and 6 mos.	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every caveat	10
On every application for a patent	15
On issuing each original patent	20
On filing a disclaimer	10
On every application for a reissue	30
On every additional patent granted on a reissue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunc tion from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

Address, DEWEY & CO., Agents,
Mining and Scientific Press Office, Government House, corner Sansome and Washington streets, San Francisco.

[ADVERTISEMENT.]

To the Public, and to Millmen in Particular.

As Thomas Varney has not, up to this date, withdrawn his notice in the "Mining and Scientific Press," in which appears the following language:—

"All persons are warned against purchasing machines made at the Miners' Foundry, called 'Wheeler's Amalgamators,' as they are an infringement on my patent, and a suit is now pending in the United States Circuit Court, against the parties infringing;"

In justice to myself I am compelled to give to the public a statement of the facts in the case, and show the position which Mr. Varney and myself occupy as Patentees. He commenced suit against me, and the Miners' Foundry, for $90,000, about the 1st of March 1863, and threatened suit against any and all persons who should buy my amalgamators, thus greatly damaging my business. To show the injustice of this suit against a "poor hard working mechanic," I will quote from the opinion of Judge Hofman, as rendered in the case last November. He says:

This is an action for the infringement of a patent issued to the plaintiff on the 16th of December, 1862, for an "improvement in Amalgamators for gold and silver." The machine alleged to be an infringement has also been patented—the patent being dated December 8th, 1863. The defendants deny the alleged infringements, and the novelty and originality of the plaintiff's invention. They have also given notice, under the statute, of various other defenses, hereafter to be noticed.

Models of the two machines were exhibited in Court, and a large number of witnesses called to explain their construction and mode of operation. It is apparent that the patented machine of the defendant closely resembles, if it be not substantially identical with, the improved and modified machine now manufactured by the plaintiff. But the inquiry is not whether Wheeler's machine resembles that used by Varney, but whether the former is substantially the same as the machine described in Varney's patent. That Varney has, in many important particulars, modified the machine as described in his patent, is obvious. Indeed, his late machines resemble much more nearly in external appearance, and in their mode of operation, the Wheeler patented machine than they do a machine constructed according to the drawings and specifications of his patent.

After describing Mr. Varney's pan and its operation, the Judge says:

It appears, however, that the idea of working ores in a batch, by causing them to pass repeatedly between mullers, the upper one of which is provided with openings at the center, is by no means novel.

J. E. Clayton testifies that, so long ago as 1845, he arranged a machine in Talladoosa, Alabama, for the reduction of gold ores, which embodied substantially the same principle.

* * * * * * *

In Overman's Metallurgy, p 267, a similar arrangement is described. * * It is evident that the author is here describing an existing and well known machine, the usefulness of which has already been ascertained.

It is also apparent that the result aimed at is the same in this machine as in that of the plaintiff, and that the means adopted to accomplish it are substantially similar. In both machines the pulverization of the ore is effected by means of a bed plate upon which a muller rotates, with central openings to permit the pulp to pass continuously and repeatedly between the grinding surfaces until the operation is completed.

Amongst other things the Judge quotes the following from Judge Story:

But in all cases where the patentee claims anything as his own invention in his specification, Courts of law cannot reject the claim, and if included in the patent and found not to be new, the patent is void, however small and unimportant such asserted invention may be.

* * * * * * *

Here the plaintiff claims a particular position of machinery as his invention, and it clearly appears in evidence that the position is not new. It has existed before—not in machines exactly like the present, but in machines applied to analagous purposes, viz: in machines applied for the same purpose as the plaintiff applies them. The objection therefore, is fatal.

In the defendant's machine, the pan in two parts, provided with flanges, packing, &c., to which the plaintiff in his patent attaches so much importance, is not used, but a deep pan is substituted with a wooden cover.

The arrangement of the slots or shoes on the muller is different. The upper muller is provided with spiral ridges arranged to operate with similar ridges reversely inclined on the inner surface of the pan, to raise the pulp and promote the circulation. The upper muller is attached to the shaft by an universal joint, and by a mechanism quite dissimilar to that described by the plaintiff. And for the scrapers are substituted broad guide plates extending and secured to the edge of the pan, and capable of being elevated or depressed by means of a mechanism not found in the plaintiff's machines.

Assuming these—as in the point of view in which we are considering it we must—that each of the several parts of the plaintiff's machine is old, and not separately patentable, it seems clear to me that if the patent for the machine can be sustained, as for a new combination; which I think doubtful, the combination of the defendant is least gata novel as that of the plaintiff.

We have already seen that the muller rotating upon a bed plate, with central openings, and arranged in a pan so as to create a circulation of the pulp, is not a new invention. The tub, composed of two parts, with flanges, packing, &c., is not claimed to have been used by the defendant. And, further, it is now discarded by the plaintiff, and a deep pan, with muller attached by an universal joint, has been adopted by him in his later machines. The infringement, if any, must consist in the use by the defendant of the scrapers described in the plaintiff's patent.

The inquiry thus arises—are the curved plates described in Wheeler's patent, substantially the same in their structure and operation as the scrapers of the Varney patent, and if so, do the latter constitute a "material and substantial part of the things patented by Varney, defiably distinguishable from the other part." To determine this question, a brief description of Wheeler's machine is necessary.

The Judge then describes the Wheeler pan and the Varney pan and scrapers, and says:

In the Wheeler pan four plates are used while Varney employs only two scrapers. The form or curve given to these plates in both machines is similar, though not identical; but in their structure, arrangement, and the use for which they are intended, there is an essential difference. The scrapers of Varney are represented as of inconsiderable width, and extending from a ring at the center to the periphery of the muller—they rest apparently upon the surface of the muller, and no means of elevating or depressing them are mentioned in the specifications or exhibited in the drawings.

The plates of Wheeler are of considerable width, and attached to a frame suspended from the top of the shaft, resting upon a vertical screw, by means of which the frame and plates attached to it may be elevated or depressed. The plates extend to the inner surface of the pan, where they are secured by slides. The office of these plates, as described in Wheeler's patent, has already been mentioned. It appears to me that the scrapers of Varney neither serve, nor were intended to serve, any such purpose. [Here the Judge gives his reasons for the above opinion.]

For these reasons I am of opinion that the curved plates of Wheeler differ from the scrapers of Varney in their form and arrangement, their object and effect, and that therefore their use is not an infringement of Varney's patent.

Much testimony was taken to show that in fact Wheeler's invention was prior to that of Varney's and that the latter derived his ideas from the former.

It is claimed by Varney that his invention was, in its essential features, matured and perfected in August, 1861. But this statement seems hardly consistent with his declarations or his conduct.

Varney's application for his first patent was not made until the end of October, 1861. That machine has since been discarded as useless.

If then, at the time of this application, he had already matured and perfected the invention of another and far better machine, he committed a practical fraud upon the public in withholding from them the benefit of his skill and ingenuity. It is certainly strange that he should have gone to the trouble and expense of procuring a patent for his first machine, and delayed, for nearly a year, his application for a patent for the improved machine which he had, as he says, already invented.

It may well be doubted whether, if it be true as Varney states, that at the time of his application for his first patent he had already completed and perfected his improved machine, the suppression would not be fatal to both. It appears in evidence that, so early as December, 1861, Wheeler had conceived and communicated to Stewart & Kirkpatrick at Washoe, the idea of his machine. He explained to them the mode in which the circulation, or over and under current was to be produced, and the guide boards by which it was to be assisted.

In January, 1862, drawings of this machine were received at the Miner's foundry, and Stewart, the partner of Churchill, was desirous of having his pans constructed on that plan. The theory and construction of the proposed pan were fully explained to Varney, who succeeded, however, by affecting to consider Wheeler's pan a "humbug," in dissuading the parties from adopting it, and in inducing them to order pans made on the model of his own patent. These were subsequently discarded as useless. We are driven to adopt one of two suppositions: either that Varney wilfully deceived Stewart in inducing him to order an inferior pan, or else that he had not at that time discovered the mode of producing the over and under current, recognized its utility and invented a machine to effect it.

Wheeler commenced manufacturing his machines in January, 1862. He commenced using them in June of the same year. They were constructed at the Miners' Foundry by the defendants to this cause, under the immediate observation of Varney. But in his conversation with Scott, in July, 1862, and in his communications with the defendants, he does not appear to have intimated that he was the first inventor of the Wheeler machine, and that in constructing the latter they were violating his rights. Up to the end of 1862, he continued to have his own pans built at the same foundry; and it he really considered the construction of Wheeler's pans to be an infringement of his own invention, his silence is inexplicable. His delay in applying for his second patent is equally unaccountable. In August, 1861, he had, as he says, completed and perfected his invention of his improved machine, and yet in October of that year he applies for a patent for his first and imperfect invention, and delays his application for a patent for his improved and perfected machine until the end of June, 1862—more than a month after Wheeler had taken the preliminary steps to obtain his patent.

It is unnecessary, however, to pursue this inquiry further, for in the view I have taken of the case the question of priority of invention is immaterial.

The Judge then notices the other grounds of defence, and says:

If this view of the effect of that statute be correct, it affords a defence to Wheeler as well as the other defendants. It is not pretended that he has used any machines not manufactured by them, or that he has infringed the plaintiff's rights, otherwise than by receiving from the other defendants the sum agreed to be paid by them on the sale of his machines.

I find, therefore, for the defendants.

[In this candid statement to the public, I should have preferred to have given the decision of the Judge and the findings of the Court in full, but for the great length of space they would occupy; and I will state that the same can be found in the "Mining and Scientific Press," of December 10th and 31st, 1864, and invite their thorough perusal.]

It will be seen by the above statements that Mr. Varney is infringing on my patent right by the use of wide guide plates in his pans, instead of my infringing on his patent.

The truth is, he never used any but narrow scrapers in his pans until after I had put my pans in operation, and they had proved a success. None of his pans made prior to the year 1863 ever run six weeks without being condemned and thrown aside. This may account for the fact the he afterwards altered his patterns and made them like mine, with an open, deep pan, and wide guide plat s instead of scrapers, and put a wooden cover on the pans.

Having established my right in my patent Amalgamator it is now my turn to protect myself against the infringement of "Mr. Varney, or any other man," and I intend to do it; and all persons are hereby warned not to purchase or use machines called "Varney's Amalgamators," as made at the Union Foundry, Pacific Foundry, or any other place, as they will make themselves liable for an infringement on my patent right.

Having made some important improvements in my Amalgamators, the public are invited to call and examine them at the Miners' Foundry, San Francisco, or at Prescott & Schiedel's Foundry, Marysville, where they ar manufactured ZENAS WHEELER

San Francisco, Dec. 27th 1864.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Saturday Morning, March 11, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Wm. R. Bradshaw—San Joaquin, Calaveras, Merced, Tuolumne, Stanislaus and Mariposa counties.

Mr. Robert Lattimore—Butte and Yuba counties.

W. H. Laws—Placer and El Dorado counties.

Thos. Poyzer, of Grass Valley, for Nevada county.

THE MOUNT DIABLO COAL MINES.

One of the most important incidents connected with our recent trip to the neighborhood of Mount Diablo was a visit to the coal mines. The mines are located upon the northerly flank of Mount Diablo, where they are found tilted up at an angle of about thirty-three degrees from a horizontal position.

The coal veins are three in number, their thickness being respectively as follows: The upper vein, 36 inches; the middle, 30 inches, and the third and lower varying from 36 to 72 inches. The second vein is about thirty feet below the first, and the third ninety feet from the second—the measurement being taken at right angles with the dip. A fourth vein, from fourteen to eighteen inches thick, has been struck by the Manhattan company, between the second and third of the regular series. The Eureka company has run a drift through what should be the plan of this vein without finding it, which affords a strong presumption that it is not a regular vein, but only a local and accidental deposit.

These veins have been prospected and accurately defined about five miles in linear extent, with an average width, as far as explored, of about 3,000 feet. The dip of the coal strata is a little west of north. There are strong indications that this coal field continues fully twenty-five miles in extent in nearly an easterly and westerly direction.

The number of companies now in operation, and taking out coal, is seven, as follows: The Black Diamond, Union, Manhattan, Eureka, Pittsburg, the Central and the Teutonia. The Black Diamond was the first discovered. It was opened in 1858. It is sometimes known as the Cumberland company. They hold two quarter sections of ground. The headquarters of the coal region is at Sommerville, a town of about 1,000 inhabitants, located in a little valley, from which the various companies run their working adits.

Our stop at the mines was too short to admit of any very extended observations. We only found time to visit one—the Manhattan. Under the guidance of W. T. Cruikshanks, Esq., the superintendent, we were kindly taken through the several adits connected with this mine, and had a fine opportunity to examine the appearance of the coal "in place." This mine is well opened, and in a condition to be extensively worked, as we presume it will be the coming season. The ventilation, a matter too often neglected in mines, is all that could be desired, and the workman, even in the very heart of the mountain, can breathe almost as pure an atmosphere as though he were upon the hill top. This mine is owned by Cruikshanks, Adams & Co. Their main tunnel or adit is about 1,000 feet in length. Some sixty tons of coal are taken out daily, and the company employ about seventy men. No night shifts are employed. The mine has been worked about three years.

The arrangements for "dumping" are very admirably arranged. The coal is brought out of the mines in cars drawn by mules—three cars in a train—and dumped upon a screen formed of iron bars, placed in an inclined position, and five inches apart. Whatever passes through this screen falls upon another formed of wire, with three-quarter inch meshes. The next screen is formed of one-quarter inch mesh. Whatever passes through this goes to "waste." The waste forms about one-seventh of the product of the mine. The three sizes of coal are conducted by inclined planes to separate receptacles, from which they are loaded into the teams by merely raising a slide connected with the several receptacles. The coal is taken thence by mule teams to the river landing at Antioch.

We gathered the following statistics with regard to several of the other mines: The Union Company, owned by Whipple & Co. employs a 25-horse power engine for hoisting and a smaller one for pumping. They raise about seventy tons of coal per day, and employ about sixty men.

The Eureka is owned chiefly by San Francisco capitalists. They have no machinery as yet. They have driven an adit 600 feet and struck a good quality of coal. This company is not doing anything at present. They will put up machinery the coming season.

The Pittsburg Company is also composed chiefly of San Francisco capitalists. They have a tunnel some 500 feet in length, raise about fifty tons per day, and employ some sixty men. They have hitherto used horse-power, but are now about to put up machinery.

We visited the works of the Independent Company, which are now under the superintendence of Mr. James Brodie, late of this city. This company was organized in 1860, soon after which they commenced sinking a perpendicular shaft, in which they expected to strike the coal at a depth of about 1,000 feet. After going down 710 feet, at which depth they found but little water, they concluded to drift for the vein. This drift was continued about 250 feet, when a large stream of water was tapped, which soon filled up both drift and shaft. The company have now been pumping away at this water for about a year and a half, with the exception of short delays for repairing machinery, etc. After expending nearly $200,000 upon the work, the company are now in a fair way to free the mine of water, which done, they will soon be able to strike the coal, and begin to get some return for their large outlay and most praiseworthy perseverance. The Superintendent informed us that the flow of water, by careful measurement, is now 1,536 cubic feet per hour, a decrease of 384 feet within the past six weeks. The influx appears to be steadily decreasing. There is now but eighty feet of water in the shaft. Two ten-inch pumps, with six feet stroke, are employed, each with three lifts.

The village of Sommerville is very pleasantly situated, convenient of access to steam communication on the Sacramento river, and only five miles distant from Antioch. The population will probably reach about 1,000, of as quiet and orderly a class of people as is often met with in any country. The stranger will find pleasant and comfortable quarters at the principal hotel, with an agreeable and accommodating landlord. We shall have more to say of the place and its mines in future numbers.

TO CORRESPONDENTS—The article on "Water Measurement," next week. We have also received an interesting article entitled "On Amalgamation of Copper—A New Re-action?" which will appear next week.

THE CALIFORNIA COPPER INTEREST.

The *Echo du Pacifique* of this city, in its issue of March 3d, makes the following allusion to the series of articles which we are now publishing on the "Metallurgy of Copper in California:"

We have read with interest a series of articles now in course of publication in the MINING AND SCIENTIFIC PRESS, of this city, under the title of "Metallurgy of Copper in California, by Dr. Paul D'Heirry." If we are to judge from our own impressions and from the sensations which these articles are producing among those interested in copper mining, this publication is destined to produce a complete revolution in California. * * * We cannot too strongly recommend to those who have an interest in this branch of our mining business, to read these articles; and we would further say that if a work of this kind had been published in proper time, on our mines of auriferous quartz and silver, a great many deceptions and millions of treasure would have been saved.

After giving a synopsis of the calculations given in these articles, the *Echo* adds:

It is seen that D'Heirry considers the question of mining for copper in a point of view completely new in this country, and gives the data for building up this branch of our industry; and further, the Doctor is about to put his advice into practice, at the mine of the Queen of Bronze Company, of which he is the engineer. He will build furnaces and send copper to our market this Summer. In his desire to see this industry developed, this metallurgist, we are told, intends to educate, at his smelting works, able workmen, whom he will be happy to distribute among such establishments as may need them; and that without any other compensation than the satisfaction of contributing to the improvement of the country, in this direction.

We observe that the attention of our morning cotemporary, the *Alta*, has also been attracted to this article, and gives, in its issue of the 4th instant, a commendatory notice thereof. Its translator, however, has evidently not fully comprehended the subject, and in consequence has conveyed some erroneous impressions to its readers. Our cotemporary would have done better to have made its compilation directly from the original articles as they appeared in our columns.

In this connection we would take occasion to say that our next issue will contain the conclusion of the series. This series of articles is intended as merely preliminary to a more extended publication, by the same writer, which will probably be issued in a book form, next Winter. Dr. D'Heirry will soon leave for Oregon, where he will put to actual test, upon California ores, (or rather Oregon ores, as the Queen of Bronze mine is located just north of the California line,) the theory which he has developed in the present series of articles. An accurate detailed account of cost and results will be kept, which will form the basis of the more extended publication he has in view. In the meanwhile we hope to hear from him, from time to time, as his work at the mine progresses.

RAPID ADVANCEMENT.—In the beginning of the month of September last, Sheridan was only a captain in the Thirteenth Infantry. Twenty days later he becomes a Brigadier, and in less than two months' time, a Major-General in the regular service. Such are the rewards of gallantry and skill.

THE COTTON IN REBELDOM.—The total amount of cotton now in the Southern Confederacy is estimated by good judges at about five millions of bales. This amount at $500 per bale, about its present worth in New York, would foot up to the enormous sum of $2,500,000,000, or nearly twice the amount of our national indebtedness.

MILITARY FOR ARIZONA.—It is understood that at least one full regiment of California Infantry will be ordered to Arizona immediately, and the Native California Cavalry battalion will be raised to a full regiment and ordered on service against the Apaches.

MATCH FACTORY BURNED.—The Eureka Match Factory, owned by Messrs. Jessup & Co., and located on the corner of Folsom and Twelfth streets, in this city, was totally destroyed by fire on the evening of the 7th inst.

A MAMMOTH FOSSIL has recently been discovered about sixty miles east of Virginia City on the Humboldt road. The discoverer is Mr. P. C. Sovereign, of Virginia City. It is described in the *Territorial Enterprise*, substantially as follows: It appears that the snout and points of the tusks projected above the level of the soft sandstone in which the animal was found, and it was seeing these that led to its discovery and exhumation. Mr. Sovereign has succeeded in digging out and preserving this truly gigantic beast in the most perfect form; those portions imbedded in the sandstone being perfectly mineralized and quite solid. The animal as it stands on its feet is about twenty feet long by five feet in hight. The entire skeleton will be exhumed and set up for exhibition at Virginia City.

NEWSPAPORIAL.—The *Daily Morning Spectator* is the name of a new and neat little daily which has made its appearance in this city during the past week. It is published by Messrs. Biven & Crossette. The *Klamath News*, a new local paper, representing the county of Klamath, has also found its way to our table the past week. It is the first and only paper published in that county. The Nevada *Transcript* has entered upon its tenth volume. This was the first daily paper started in Nevada county. The Shasta *Courier* has commenced its fourteenth volume and the fourteenth year of its existence.

SHERMAN has been called a military *boomerang*, from the peculiar eccentricities of his movements—here to-day, there to-morrow; circling first for one point, then towards another, and always striking where least expected by his object. He is a proficient in his peculiar tactics, which are quite as little conformable to the rules of military science, as at present understood, as were the movements of the boomerang to the mechanical knowledge of those who first observed the operation of that singular weapon.

THE REBEL LOAN.—With the capture of Wilmington, all hope of effecting further rebel loans in Europe must have vanished. For a year past cotton bonds have been the only marketable Confederate securities in Europe. The payment of this paper was secured by vast quantities of cotton alleged to have been stored in the Southern States, beyond the reach of Federal seizure. This cotton must now fall into the hands of the Federal authorities, at least so much of it as is not destroyed by the Confederates.

AFTER THE DELINQUENTS.—The Reese River *Reveille*, which has recently sailed into its delinquent mining advertisers rather ferociously, contains not less than fifteen summonses in which the proprietors are plaintiffs, and against so many different mining companies. Several other papers "over the mountains" are threatening a similar course before the sage-brush gets into bloom, unless the delinquents "fork over."

THE MINERAL LAND BILL.—The Washington correspondent of an evening cotemporary says that a mineral land bill has been matured with a chance to become a law, providing for the survey of mineral lands into 160, 100, 80, 40, 20, 10 and 5 acre subdivisions, with the minimum price fixed (at first) at something over $20 per acre—valid pre-emptions to be recognized, etc.

THE Julia is one of the neatest little steamers which ever floated on our interior waters. This will be remembered as the boat which was recently built in such a substantial manner, at Steamboat Point, in this city, for the California Steam Navigation Company.

ANOTHER LANDMARK GOING.—Preparations are nearly completed for removing the old Tehama House, to make room for a modern and more substantial structure, to be occupied by the Bank of California and by Mr. Newhall, the auctioneer.

THE London *Times* says General Sherman's present campaign will rank hereafter among the most memorable campaigns of modern warfare.

THE EASTERN COPPER, COAL AND IRON MARKETS.

COPPER.—American Ingot is lower, with an unsettled market—45 to 46c for Lake and Baltimore. Sheathing and Yellow Metal steady at 65c for the former and 50c for the latter.

IRON.—The market for Pig is dull and unsettled; prices declined to $55@56 for No. I American, and $56@57 for Scotch.

COAL.—Market active, by reason of the severity of the season. Prices improved and firm, $10@12½ from yard.

PETROLEUM.—Under the material decline in gold, the market at latest dates was quite unsettled, buyers mostly refusing to operate except at a great decline, to which holders generally refused to submit. There has been nothing of moment taken for export since September 1st, 1864. The market is dull at 45@46c for crude; 64@65c for refined in bond, and 83@84c for refined free.

BRITISH METAL MARKET.

The London metal market, at latest dates, was dull, with not much change since the close of the year. An early improvement in business was expected, with a corresponding advance in prices. An expectation of high prices ruling for some time was generally entertained.

COPPER.—A sale of ten tons of Ingot (Vivian's make) is reported at £87 ₱ ton.

MESSRS. EDITORS:—In your issue of the 4th inst., under the heading of "Rich Ores," some mistakes have occurred which we would wish to have corrected. You say in your report that 1,100 pounds of rich rock from the Osceola mine, Montgomery District, were worked by "White & Murphy," which should be "Kimball & Murphy." You also put "capriferous" for "cupriferons," and "silver glance" where it should be "silver-copper glance;" and again, you say "16 per cent. antimony," which should be "16 per cent. copper." This lot of ore being worked by us, and not knowing any firm of the name of White & Murphy on this street, we trust you will do us the justice to make the correction, and oblige,

Yours, etc., KIMBALL & MURPHY.

European Metallurgical Works, Bryant street, San Francisco, March 6, 1865.

REESE RIVER.

Late advices from Reese River speak in flattering terms of mining operations there. The Amador, which, the *Reveille* says, has an incline now of 225 feet on the vein, in which the ore is estimated at seventy-five dollars per ton. Selected rock pays $150 per ton. The vein is over six feet in thickness. The Revenue Company are taking out very large quantities of rich ore and an occasional ton of the very richest known to miners. Within a short time past they have selected as first class ore 3,500 pounds, worth between $5,000 and $6,000. It is situated on Lander Hill, adjacent to the principal rich mines. The Sam Brannan Company, we learn, are also doing well.

CALIFORNIA.

The Nevada *Transcript*, of the 2d instant, says:

The weather of the past week has been cold enough to freeze up the diggings and cause a very general suspension of mining operations throughout the county. We know of several companies on Gold Flat and in this vicinity that were compelled to stop "cleaning up" in consequence of the freezing weather of the past three days. In the mining camps further up in the mountains all mining operations must be entirely suspended at this time. Very few of the largest mining companies in the county, though considerable washing has been done, have "cleaned up" during the season, and therefore no very large quantities of dust have yet been brought into the market. The miners are taking advantage of the great abundance of free water to "wash down," when the weather is not too cold, leaving the result to be found later in the season. The treasure taken out during the coming Spring and Summer will far exceed the product of any season for the past five years.

The Nevada *Gazette* learns that the Irish and American Company at Birchville cleaned up last week, after seven days' washing, and realized the handsome sum of $12,000.

The Quincy *Union* says that the owners of the Indian Valley Quartz Mill are putting in ten additional stamps, which will soon be ready. The McClellan mine, owned by H. C. Bidwell and others, is yielding larger than ever before, and can now be ranked with the best paying mines in this State. It is paying regular monthly dividends to the owners. One-half of this mine was recently purchased by the present owners for $16,000 cash. The yield for the last ten days has been near $1,000 per day. This, for the number of stamps employed, is far ahead of any mine in the county. Messrs. B. & Co. contemplate the erection of a large steam mill in the Spring. Messrs. Wibls Bros. have sold their ledge, for $14,000 cash, to Messrs. Howell & Co., of San Francisco. Mr. H. is on the ground, making extensive improvements to open and work the mine. The Shortell ground, on the same ledge, and adjoining this claim, was purchased last week by Bidwell & McClellan, who intend developing it at once. Mr. B. also purchased the Eureka and Excelsior ledges, in Cherokee District, and is working rock from them in the Dixie mill, which is paying well.

ESMERALDA.

The Esmeralda *Union* gives the latest mining intelligence from Montgomery district, essentially as follows:—

The latest good strikes are in the Mountain Brow and Mary, owned by Fitzhugh & Co. These ledges are well developed with rock, showing as well as in the camp. The furnace of Carter & Donegan has run with success, until the cold snap of weather set in. Muuckton & Hancock's arastra and amalgamator are in full operation. They have been running on the Mountain Queen's second-class rock. The yield is within a few dollars of two hundred per ton. They are now working Washington, and from present appearances, the rock will yield largely. The Eclipse company are now taking out ore for the arastra, and in a few days we will know the result.

The most promising lead in Columbus district is the Baluerde. It is about nine feet thick and quite rich. The *Union* learns that a specimen "about the size of a flour-barrel," of extraordinary richness, has recently been taken out and will be sent to San Francisco. A mill is to be erected forthwith near the claim, by a San Francisco capitalist, who is a large shareholder in the company.

The *Union* says that the agent of the New York company (Anthony Arnoux, Esq.), who was about to erect a ten-stamp mill in connection with the Consort company's leads near Owensville, has, within the past week, visited this and Key's district and has changed the location of the mill. It will, within a few weeks, be on the ground here, ready for the commencement of its erection. We have had quite a number of transient visitors here lately from Aurora, Virginia and elsewhere.

A rich strike is reported in Bodie. It is said to be the most promising discovery ever made in the district. The Bodie folks are jubilant over the matter.

A quantity of ore weighing four tons was taken from the claim on Silver Hill known as the Duke of Wellington, last week, and sent to the mill for reduction. The four tons yielded $1,100. A contract has been let to take out one hundred tons more.

WE ARE NOW OFFERING OUR IMMENSE STOCK

—OF—

FINE CUSTOM MADE CLOTHING

—AND—

Gents' Furnishing Goods

AT PRICES THAT DEFY COMPETITION.

Our Stock of Clothing Consists of

Now in Its Tenth Volume!

—THE—

Mining and Scientific Press,

—THE MOST—

Profitable Newspaper

—FOR THE—

Readers of the Pacific Coast.

Issued Every Saturday Morning.

DEWEY & CO., Publishers.

Our Journal enters its TENTH VOLUME with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

We believe that the PRESS furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the MINING AND SCIENTIFIC PRESS substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,

An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders.
A Faithful Monitor for Stockdealers,

An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to all Industrial Classes

Upon the Pacific Coast. We shall give accurate and frequent

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes).....$5.00
Six Months, (one volume).....3.00

FOR ADVERTISING

Our terms are very reasonable. MINING COMPANIES are especially favored by our rates, and careful attention is given to the publication of MINING NOTICES.

OFFICE in Government House, Nos. II and 56, corner of Washington and Sansome streets, San Francisco.

DEWEY & CO., Publishers.

C. W. M. SMITH.....W. B. EWER.....A. T. DEWEY

CARLYLE is reported to have said: "Let America succeed, and England goes to democracy by express train.

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—EDS. PRESS.

To Mining Secretaries.

We positively refuse hereafter to receive advertisements of any mining company for the payment of which the Secretary is unwilling to vouch. We shall also exercise the right to eject from our columns, at any time during the course of publication, any advertisement for which payment is not made, or security given upon proper notification.

DEWEY & CO.,
Publishers Mining and Scientific Press.

REGISTER YOUR LETTERS.—In remitting cash for subscriptions to the MINING AND SCIENTIFIC PRESS, our patrons will please register their letters, and we will then be responsible for their reception. Parties remitting without registering their letters will do so at their own risk. The fee for registry is twenty cents, for which a receipt is returned by the Postmaster to the sender from the party receiving the money.

N. LOMBARD INGOLS,

EUREKA

Patent Blasting Powder Company,

Office, southeast corner Battery and Commercial streets. Room No. 0, with San Francisco Chemical Works, SAN FRANCISCO.

CHARLES A. JAMES.....AGENT.

For underground blasting in Tunnels, Mines, etc., this Powder possesses very great advantage—on account of it giving out but a very light smoke. By using the same quantity in bulk as the gun blasting powder, you produce a much greater effect. 10v10

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character. After a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphurets, pyrites, and the (so called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties, on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. KIMBALL, J. R. MURPHY.

EUREKA

IMPROVED SELF-ADJUSTING

CLOTHES WRINGER,

AWARDED THE FIRST PREMIUM

At Oregon State Fair in 1864.

Abstract from Examining Committee's Report of the San Francisco Mechanics' Institute Industrial Exhibition of 1864:

"CLOTHES WRINGERS.—A variety of these excellent Household Helps were found competing for popular favor.—Though none of them are entitled to a Premium, we consider the EUREKA, exhibited by M. E. Traver & Bro., worthy of honorable mention." [*Note*—No Premiums were awarded to articles of Eastern manufacture.]

The EUREKA CLOTHES WRINGERS are made superior to all others by the use of

PATENT ELLIPTICAL STEEL SPRINGS,

Which produce a UNIFORM PRESSURE upon garments of every size.

The IMPROVED EUREKA has the HINGE CLAMP, which will fit any tub or box perfectly. Its entire construction is simple and excellent. Every family should have one. It will soon RE-PAY ITS EXPENSE in saving time, labor and clothes.

M. E. TRAVER & BRO.,
General Agents, San Francisco.

These Shirts are too well known to need any comment, both for perfect fit and quality. A large supply always on hand. Also, the largest stock of Gents' Fine Furnishing Goods on the Pacific Coast. Try one of his Shirts, and you will never wear any others.

S. W. H. WARD & SON,
323 Montgomery Street (Odd Fellows' Hall).
New York House, 387 Broadway. 10v10

THE "LIQUID BITUMEN" OF CUBA.—This bitumen is pasty, adheres strongly to the fingers, and has the aspect of coal-tar, becomes fluid upon boiling water, has a density of 1.33, and is entirely soluble in benzole. Liquefied, and projected upon cold water, it floats. Distilled, it gives 67.18 liquids, 12.38 gases, and 20.44 coke. During the distillation, it first liquefies, then swells up, at which moment clear water passes over in small quantity. The mass then sinks down and boils tranquilly, a little more milky and very sulphurous water passing. Oil of an amber color then distills over. Finally there passes over a thick ropy oil, of an orange-yellow color (ruby red by reflected light), which solidifies in the neck of the retort, and in the recipient. This thick portion contains paraffine, and 80 or 85 per cent. of the crude liquid consists of oil resembling oil of schist. The coke is very light and porous, and contains 91.56 of carbon and 8.44 of ashes, which latter are reddish, ferruginous, and similar to those before described. The author says that no bitumen of this species exists in France or Europe, and that it resembles the pasty bitumens of Asia and of Canada. In other words, it is a variety of thick petroleum.—*American Gas Light Journal.*

SINGULAR DEPOSIT OF CRYSTALS.—The editor of the *Monongahela Republican* has been shown a singular and beautiful crystal line formation in a common water pitcher. He says: After the rain storm on Friday evening the lady who was using the pitcher on her toilet stand, had it filled as usual from the cistern. The water held in solution some coal soot, but not more than usual after a rain in our coal burning districts, and the pitcher full was set aside until morning. To her surprise the morning light showed the coal crystals precipitated upon the sides and bottom of the pitcher, forming flowers, trees and bushes, with every delicate leaf, petal and branch peuciled in the most charming manner. We have seen many experiments in crystalization, and have been delighted with them, but this specimen, formed into beautiful, most beautiful flowers, surpassing the finest engraving, has been admired by all who have seen it, in terms of surprise and delight.

SILVER IN NEVADA COUNTY.—The Grass Valley *Union* says: J. M. Maguire, Esq., has exhibited to us specimens of ore from the Vernon ledge, on Mineral Hill, half a mile south of Rough & Ready, with certificate of assay, showing seventy-one dollars in silver and five in gold. The assayer remarks that this ore cannot be worked by any of the mills in this vicinity, but offers to work it at San Francisco, by a process now in use there, at thirty dollars per ton. It is the intention of the company owning the ledge, to reduce the sulphurets, and ship them to San Francisco.

IN a little tableaux performances at Winsted, Connecticut, lately, where a lad was to hold himself and lips in marble repose within kissing distance of a maiden's plump and dimpled hand, the young scamp so far forgot himself and the audience that he fell to kissing it in unaffected earnestness. The audience applauded, but there was a different expression behind the scenes shortly after.

TO OWNERS OF MINES.

As many mines are being offered in the New York market, and as experience has proved that not one in ten of the titles are in proper form, we will state that the following is considered a good title:—

1. Copy of Notice of Location certified to by Recorder of District.

2. Certificate of Notary that A. B. is Recorder of District.

3. Deed of Power of Attorney from Locators to party selling, which deed or power of attorney must be recorded in the county in which the property is located.

4. Certificate from County Clerk that Notary and County Recorder is duly qualified.

C. A. CRANE,

9v10-1m No. 4 Cedar street, New York.

MAXIMILIAN AND THE CATHOLIC CHURCH.—Believing Maximilian to be a devout Catholic, the priesthood rejoiced at his successes in Mexico. But he has disappointed the expectations of the Church. He has announced a determination to tolerate all religions, to confirm the seizure and sale of the Church property by Juarez, to require the clergy to submit to the jurisdiction of the civil courts, to reserve to himself the right to nominate the Bishops and Archbishops, and to restrict the number of convents and nunneries. He recognizes the Catholic as the established Church of Mexico, but its chief officers must be chosen by him, and all the clergy must be paid by him, so that they must depend upon him for their only hope of advancement, as well as for their pecuniary support. It is quite probable that Maximilian's late reverses are due in a measure to the coolness or hostility of the priesthood.

NEW MINES.—A few days ago, a party of prospectors from Carson City returned to that place from an exploring tour for mines. This party went about thirty-five miles east from Pyramid Lake, where they found several well defined ledges. Two assays made of the croppings showed respectively $163 in silver and $16 in gold, and $88 in silver and $9 in gold. The ledges average about five feet wide on the surface, and run the usual course of all paying ledges—north and south. They are distant from wood and water eleven miles. A portion of the party have again gone out, fully supplied with tools and provisions. These mines are located in the heart of the Piute county, but the Indians are friendly.—*Virginia Union.*

WM. BRUCKNER'S
Furnace for Roasting Ores,

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on mule back, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron Cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,
5v10 No. 416 Market Street, San Francisco.

IMPORTANT INVENTION.
Hunter's Concentrator, Amalgamator and Separator.

For the concentration of Gold, Silver and Copper ores, and separating all kinds of metals from the sands, where the specific gravity of the metal is greater than that of the rock, a machine is now on exhibition at No. 521 Market st., above First, at BACON & WEBSTER'S Quartz Grinding Works, where it will be running from two to three o'clock P. M., for the inspection of all interested in mining. The Inventor is prepared to manufacture machines to supply all orders promptly. The sixth of a horse power is sufficient to run one of these machines. For the above machine a patent has been applied for. Orders for machines, or for circulars and further information, should be addressed to

ANDREW HUNTER, Inventor.

The following extracts from Reports are submitted to the public as giving the results of a fair working test of these machines:

BEAR VALLEY, DEC. 12, 1864.

MR. A. HUNTER—*Dear Sir:* I take pleasure in stating, in reply to your request, that your concentrator has now been running uninterruptedly, at Princeton Mill, for more than three weeks, and the enclosed notes, by the Superintendent Mr. Williams, of a carefully measured test of its performance during a period of a day and three-quarters, I believe fairly indicates what it has been doing through the whole of that time. First, the loss of sulphurets, per cubic foot of tailings from the Concentrator, was about one-tenth of an ounce. Second, the loss of sulphurets from the blankets was nearly *fifteen times greater* than that from the Concentrator. The Concentrator has not been found at any time in the slightest manner out of order, and has required scarcely any attention. Congratulating you upon the these facts, I am, sir, very respectfully yours. FRED. LAW OMSTEAD,
Manager Mariposa Company.

Notes of test run of Hunter's Concentrator—it having been supplied during the test with the sands reduced by one battery of the Princeton Mill, in the condition in which they are usually received by the blankets:—

Running time	1¾ days.
Amalgam saved on the plates of the Separator during above time, value	$6 75
Rate of saving of single machine per day	3 86
Rate of saving of six machines per day	23 16
Yield of Sulphurets, 1¾ days, pounds	215
Yield of Sulphurets, one days run of one Machine	123
Rate per day of saving from six machines, being the whole number required for the Princeton Mill	738
Yield of amalgam from plates of Separator, per ton of rock crushed, value	55
Yield of sulphurets from Separator per ton of rock crushed, pounds	18

HANNIBAL WILLIAMS,
Superintendent Princeton Mill.

SAN FRANCISCO, DEC. 13, 1864.

I have recently examined one of Hunter's Concentrators and Amalgamators, in operation at the Princeton Mill, Mariposa Estate, the sand and crushed rock, flowing from one battery of four stamps, passing directly over the machine, without using blankets. On examination, it shows conclusively that the loss of sulphurets by the machine is much less than by the blankets, being but a mere fraction of the sulphurets, consisting of the light and thin scales, such as can scarcely be saved by panning; while on the other hand the tailings from the blankets contain a large amount of heavy sulphurets. The output of the machine is almost pure, clean sulphurets—the copper plates of the machine, being amalgamated, securing much or all of the free gold that escapes the battery. I witnessed the cleaning up of the machine, and the collection of a ball of amalgam. From the weights taken we may state the constitution of this ore, as it came from the batterics at that time, as follows:

Clean Sulphurets containing free gold and amalgam	18.00
Quartz sand, waste	1081.78
Loss of Sulphurets and tailings	.22
Total	2000.00

WM. P. BLAKE,
Professor of Mineralogy, Geology and Mining, Mining and Agricultural College, California.

Hunter's Machine was Illustrated in the Mining and Scientific Press of December 24th, 1864.

THE WAY FORT MCALLISTER WAS STORMED.—When the assault was made on Fort McAllister, at Savannah, those of our soldiers who formed the front ranks of the assaulting party leaped into the trenches, and those who followed rushed across the space, walking upon the shoulders of there comrades, who become a living human bridge. The assault was a very daring and successful affair, and occupied but a few moments.

The Emperor of the French is laying out a city, where but lately was a fishing village, St. Naire by name near the mouth of the Loire, which he hopes will rival Liverpool and draw to France the commerce of all nations. The population of the town has increased from 1,000 in 1857, to 15,000 now. Two lines of railroad connect it with Paris, and the government is now building nine ships of 3,000 tons each, to engaged in the Mexican and West India trade.

THE American sentiment of unity is revealed every day in the informal truce of the picket lines, a truce seldom broken, and which shows how different are the feelings of the men who conspire and the men who fight.

Russia having suppressed the Polish rebellion, is now engaged in putting down Popery, which encouraged the rebellion in the Czar's dominions.

Hansbrow's
MINING PUMP.

Six-Inch Cylinder—Eighteen-Inch Stroke—Four-Inch Suction—Three-Inch Discharge—Capable of Forcing Two Hundred Feet high with ease; Also—

HANSBROW'S FIVE-INCH DOUBLE CYLINDER,

A Powerful Hand Pump, throwing a two and a half inch stream; Also—

Hansbrow's Deep Well and Windmill Pump.

All Sizes for sale by

LOCKE & MONTAGUE,

Nos. 112 & 114 Battery Street. 2v10

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.
1 Golden State Iron Works, San Francisco.

FARRAND'S
Oscillating Amalgamator,

RECEIVED THE
ONLY PREMIUM
AWARDED FOR AMALGAMATORS
At the Recent Industrial Fair
OF THE
Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN, W. T. GARRATT, H. P. WAKELEE,
O. GORE, GEO. JOHNSON, C. M. RANCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,
R. L. OGDEN, Agent, SAN FRANCISCO.
S. E. corner Montgomery and California streets.
19v9

Boot-Blacking Machine.

This late "YANKEE INVENTION" has arrived in California, and can now be seen

At the St. Lawrence Hotel, Market Street.

This machine is a great labor-saving invention, and will be found of especial value in large hotels, and for use at all boot-blacking stands, etc. The public are requested to call at the St. Lawrence Hotel and decide for themselves with regard to its merits, rather than to make up their minds as to its value from some peripatetic news-reporter, who may be a better judge of tangle leg whiskey than mechanical ingenuity. Rights to use this Machine for sale.
7v10 **A. E. WHITE.**

Correct blank forms for advertising, and any information desired by advertisers, will be furnished, gratuitously, at the office of the MINING AND SCIENTIFIC PRESS.

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

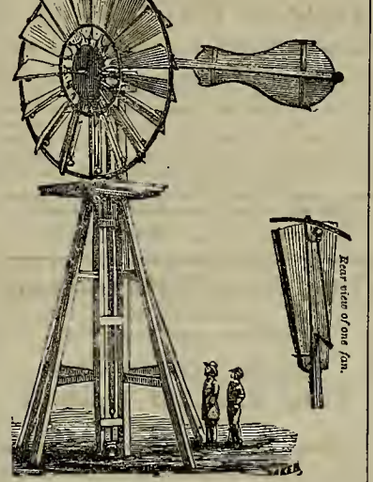
ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.
ALSO, THE
Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.



ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S
Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

Pacific
BEATER PRESS
Company.

SAN FRANCISCO, CALIFORNIA.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other

HAY AND COTTON PRESSES.

This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay, in dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.

The fact that Beater Pressed hay commands a BETTER PRICE in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.

This press is equally efficient for Cotton, Wool, Pulu, Tow, Hemp, Hair, Manilla, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties interested are invited to call and see one in operation.

Office and Warehouse—MISSION STREET, between Main and Beale streets.

W. H. MITCHELL,
2v10 **General Agent.**

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of weed and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine	No.	Fine
Assay.....	250	913	Assay 300	990
Assay.....	285	941	Assay for Ozotman	980
Assay.....	286	940	Assay Water Rock	966
Assay.....	291	950	Assay Water Rock	998
Assay.....	.. .	.....	St. Helena Ledge, W. D.	966

These, including a number of other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

Disney's Cylinder Amalgamator.
The Cheapest and Best.

DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.
San Francisco, Juno 23, 1864. 1-3m

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**
1v10 San Francisco.

THE NOVELTY.

This ROTARY CYLINDER GRINDER & AMALGAMATOR *did not receive* the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up, and, in fact, is a perfect machine.

In offering his Amalgamator to the mining public the Inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker on mining machinery, that there was room for improvement in that direction, and that he has, by careful study, invented his improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.

This invention consists of a cylindrical-shaped case placed horizontally on legs, and provided with dies one and a half inches thick, making seven square feet of grinding surface, and having a rotary oblique muller (one or more) placed within it, and covered with shoes one and a half inches thick, and so constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the German Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pulp in one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.

H. L. HOPKINS,
1v10 Inventor and Patentee.

DUNBAR'S
PATENT SELF-ADJUSTING
Piston-Packing.

Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.

IT WILL SAVE EACH SEASON MANY TIMES ITS COST in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this VALUABLE IMPROVEMENT, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,
23v8 Golden State Iron Works, San Francisco.

HUNT'S NEW DITCHER.

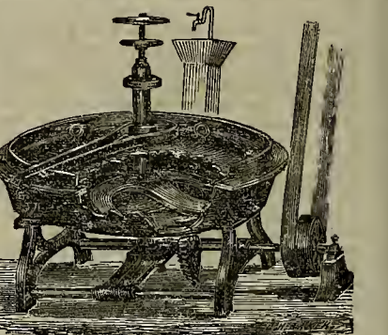
HAVING SECURED FROM THE INVENTOR THE SOLE right to manufacture these Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to

E. O. HUNT,
Windmill Builder, No. 28 Second Street and 110 & 112 Jessie Street, San Francisco. 9v22tf

PRATER'S
PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed



It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kastel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 864.] HEPBURN & PETERSON.

NOTICE TO MINERS.
NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of the celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, calculate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY, Engineer,**
24v9

TO QUARTZ MINERS.
Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street.

1852. 1865.
Thirteenth Year of Publication.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day are published as Serials, from week to week, in THE GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished talent in the Atlantic States and Europe; including "Orpheus C. Kerr," Fitz Hugh Ludlow, G. B. Densmore, "Mark Twain," Dan De Quille, Florence Fane, Miss Emma Hardinge, Sarah E. Carmichael, Annie E. Fitzgerald, "Occasia Owen," Alice Mason, William Simpson, Chas. F. Stoddart, "Ina," H. C. Williston, "Albion," "Fairfax," Bonnevel, Mary Kyle Dallas, Margaret Hosmer, and many other accomplished writers of Fiction, Romance, Novels and Stories, Poetry, Essays, Sketches, etc., etc., comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

IN THE DISTRICT COURT OF THE FIFTEENTH JUDICIAL District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property; and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk.
By G. C. LETCHER, Deputy Clerk.
C. Sims, Attorney for Plaintiff. 7v10-3m

And in accordance with law, and an order of the Board of Trustees made on the 11th day of January, 1865, so many shares of each parcel of said stock as may be necessary will be sold at the salesroom of Cobb & Shiton, No. 406 Montgomery street, San Francisco, on Monday, the 13th day of March, 1865, at the hour of 12 o'clock M., of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale.

W. FELL, Secretary.
Office, No 53 Montgomery Block, San Francisco. 7v10

Mammoth Gold and Silver Mining Company,
Silver Mountain District, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 12th day of December, 1864, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, or to H. D. SCOTT, Superintendent, at Silver Mountain.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 3d day of April, 1865, to pay the delinquent assessment, together with costs of Advertising and expenses of the Sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.
Office, No. 430 Montgomery street (Room No. 5, up stairs), San Francisco.

NOTICE.—On account of errors in previous proceedings, the above assessment notice is published anew, and stockholders who have paid on the previous notice will be credited accordingly.

7v10 J. WARREN CLARK, Secretary.

Morning Star Gold and Silver Mining Company, Echo District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of December, 1864, an assessment of one dollar and twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to J. W. Shanklin, Secretary and Treasurer, at the office of the Company, No. 625 Merchant street, U. S. Land Office Building, San Francisco.

This assessment is made subject to such credit for the stockholders as may have been allowed them on any payments of assessments, or expenses of incorporation, and the filing of the necessary vouchers on the same.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 1st day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. W. SHANKLIN, Secretary.
Office, No. 625 Merchant street, San Francisco. 3-4

Mina Prieta Silver Mining Company, District
of Ures, Sonora, Mexico.

☞ All persons are hereby cautioned against purchasing any of the following described stock, sold February 6, 1865, for delinquent assessment No. 29 (levied December 20, 1864,) and expenses, as said stock will not be transferred on the books of the Company—viz:

GEO. R. SPINNEY, Secretary.
Office, No. 240 Montgomery street.
San Francisco, Feb. 13, 1865. 7-4t

THE MINING AND SCIENTIFIC PRESS.—We call the attention of our readers to an article from this valuable journal, explaining some of the reasons why it should be supported. We have no hesitation in saying it is one of the most deserving publications on the coast, in fact, the only legitimate mining journal in California. Every practical pick and shovel miner, as well as every man who may be anywise interested in mining, should have the *Press* for his own information, aside from its scientific value. Its editors and contributors are men of practical experience and qualified to speak that which they know.—*Grass Valley Union.*

A VALUABLE NEWSPAPER.—The "Mining and Scientific Press," published by Dewey & Co., in San Francisco, is a useful and instructive journal for the miner and mechanic offering a vast fund of information respecting the working of metallic ores, the improvements in mining and other machinery, etc., etc. The Press deserves a liberal support from miners and artizans. Terms—$5 per annum, or $3 for six months.—*Placer Herald.*

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the MINING AND SCIENTIFIC PRESS. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

New Era Copper Mining Company, Salt Spring District, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 2th day of February, 1865, an assessment of twenty-five cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 1st day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 15th day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

C. B. TOWLE, Secretary.

Office, S. W. Corner of Stockton and Washington streets, San Francisco. fe25

New Year Diggings Gold and Silver Quartz Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 3d day of February, 1865, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, which assessment has been levied to liquidate the debt of the company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 11th day of March, 1865, will be advertised as delinquent, and unless payment shall be made before will be sold on Saturday, the 25th day of March, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

AUG. KUNAST, Secretary.

Office, No. 540 Washington street, San Francisco. feb4-5-4

POSTPONEMENT.—The advertisement of Stock delinquent on the above assessment is hereby postponed until Saturday, March 18th, 1865, and the sale thereof until April 1st, 1865. By order of the Board of Trustees.

mar11 AUG. KUNAST, Secretary.

Oroville Gold, Silver and Copper Mining Company, Oroville, Butte county, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 30th day of January, 1865, the several amounts set opposite the names of the respective shareholders as follows:

J. M. BUFFINGTON, Secretary.

Office, Nos. 7 & 10, Government House, corner Washington and Sansome streets, San Francisco. mar4

"A WORD TO THE WISE," ETC.—Parties in the Eastern States who desire positive information concerning the mineral wealth and developments of the Pacific States, should look for the same in some journal, published on this coast sufficiently truthful to enjoy a permanent circulation in the communities represented. Those credulous enough to patronize the mushroom bantlings of defunct California Jeremy Diddlers may expect to get "bilked."

MINING PRESS.—The San Francisco *Mining Press* has entered upon its tenth volume, and bears evidence of increasing prosperity. Dewey & Co. have, by untiring industry, made the *Press* one of the leading papers of the State, and as a mining journal it has no superior in the country Those interested in the mines on this coast can make no better investment of five dollars than by subscribing to this excellent journal.—*Alpine (Markleeville) Chronicle.*

Pioneer Coso Gold and Silver Mining Company, Coso District, Tulare County, California.

And in accordance with law, and an order of the Board of Trustees, made on the 21st day of July, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the salesroom of Jerome Rice & Co., No, 327 Montgomery street, San Francisco, on the 3d day of September, 1864, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

GEO. L. FAULKNER, Secretary,

8 Office, of the Company 411 Clay St., San Francisco.

POSTPONEMENT.—The above sale is postponed until Saturday, October 1, 1864, at the same hour and place. By order of the Board of Trustees.

10 GEO. L. FAULKNER, Secretary.

POSTPONEMENT.—The above sale is postponed until Saturday, October 29th, 1864, at the same hour and place. By order of the Board of Trustees.

15 GEO. L. FAULKNER, Secretary.

POSTPONEMENT.—The above sale is hereby postponed until Tuesday, January 31st, 1865. By order of the Board of Trustees. (le) GEO. L. FAULKNER, Secretary.

POSTPONEMENT.—The above sale is hereby postponed until Monday, the 1st day of May, 1865. By order of the Board of Trustees.

6-3m GEO. L. FAULKNER, Secretary.

Rose Gold Mining Company, Location, Mariposa county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of March, 1865, an Assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable on the 6th day of March, 1865, in United States gold and silver coin, to the Secretary, at the Office of the Company, No. 338 Montgomery street (Room No. 12), San Francisco.

Any Stock upon which said assessment shall remain unpaid on Saturday, the 8th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 25th day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

C. M. PECK, Secretary.

Office, No. 338 Montgomery street (Room No. 12), San Francisco.

A discount of five (5) per cent. will be made on all moneys paid on account of assessments paid on or before March 14th, 1865. By order of the Board of Trustees.

mar4 C. M. PECK, Secretary.

Scottie Gold and Silver Mining Company, La Paz District, Arizona Territory.

And in accordance with law, and an order of the Board of Trustees, made on the 25th day of January, 1865, so many shares of each parcel of said stock as may be necessary, will be sold, at Public Auction, by Edwards, Olney & Co., Auctioneers, at the Company's office 528 Clay street, San Francisco, on the 13th day of March, 1865, at the hour of 1 o'clock, P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

B. W. MUDGE, Secretary.

Office, No. 528 Clay street, San Francisco. fe25

Information Wanted.—A letter mailed at Nevada City, Cal., about January 28, 1865, signed by Jas. R. English, and addressed to this office, has failed to reach us, and we hereby offer a suitable reward for any information which may be given us of its whereabouts.

8v10 DEWEY & CO.

Santa Cruz Petroleum Oil Works Company, Santa Cruz County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22d day of February, 1865, an assessment of forty cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 53 Montgomery Block, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 1st day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 17th day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

W. FELL, Secretary.

Office, No. 53 Montgomery Block, San Francisco. mar4

Southern Light Gold and Silver Mining Company, Reese River Mining District, Lander Co., Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 27th day of February, 1865, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable on the 28th day of February, 1865, in United States gold and silver coin, to the Secretary, J. A. Drinkhouse, or to H. L. Dawley, Superintendent, at Austin, Nevada.

Any stock upon which said assessment shall remain unpaid on Saturday, the 1st day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Wednesday, the 19th day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. A. DRINKHOUSE, Secretary.

Office, No. 228 Front street, San Francisco. mar4

CAUTION.

San Rafael Mining Company, Ranchita, Lower California.

The following Certificate of Shares in the capital stock of the above named Company were sold at auction, February 15th, 1865, to pay delinquent assessment levied December 21st, 1864, together with costs of advertisement and expenses of sale:—

In name of	No. Certificate.	No. Shares.
Francis Elmer.....	8	100

Parties are cautioned against purchasing the above described Certificate of Stock.

E. A. HAWLEY, Secretary.

mar4 No. 229 California street, San Francisco.

Troy Gold and Silver Mining Company, Reese River District, Lander county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 2rst day of March, 1865, an assessment of $2.50 per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 303 Commercial street, in the city of San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 1st day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 15th day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

H. ENGELBRECHT, Secretary.

Office, No. 308 Commercial street (up stairs), San Francisco, Cal. mar4

United States Mining Company, Virginia District, Storey County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 20th day of January, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the 20th day of January, 1865, so many shares of each parcel of said stock as may be necessary, will be sold, at public auction, by Maurice Dore & Co., 327 Montgomery street, San Francisco, on the 11th day of March, 1865, at 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. M. BUFFINGTON, Secretary.

Office, Nos. 8 & 10 Government House, corner Washington and Sansome Streets, San Francisco, Cal. fe25

INVENTORS AND INVENTIONS.—Let us not cheapen inventions, but be kind to the inventors; beware of killing the goose that lays the golden egg! Many inventors die before the hour of triumph; others falter by the way. Invention is a struggle, a conflict, almost a battle; if the victors are rewarded, the dead are honored and the wounded carefully attended to. Glorify the inventors who succeed; cover with an indulgent self-respect the faults of those who fail; and soothe the last years of the wounded—those invalids of industrial science who have known only the pains of the fight, and always remained ignorant of the joys of victory. —[Damas.

Quartz Ledge For Sale.

THE entire right, title and interest in a Quartz Ledge in this State is offered for sale. Abundant and reliable evidence of its richness, with further particulars, will be furnished to parties addressing, with real name, "J. H. W." Lock Box 1,093, San Francisco Postoffice. 7v10

W. T. GARRATT,
City
BRASS AND BELL FOUNDER,

Cor. Market and First Sts., opposite Oriental Hotel, SAN FRANCISCO.

Manufacturer of Brass, Zinc, and Anti-Friction or

Babbet Metal Castings;

CHURCH AND STEAMBOAT

BELLS,

TAVERN AND HAND BELLS AND GONGS,

FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, &c.. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles,

HYDRAULIC PIPES AND NOZZELS

For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

☞ Highest Market price paid for OLD BELLS, COPPER AND BRASS. ☜ 6tf

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address **J. MOSHEIMER,**

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pala, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Principal office, Brandreth Building, New York.

OUR CORRESPONDENTS, although thoughtful and modest men, all "speak well for themselves" in their communications to-day.

THE MINERS' FOUNDRY.

We give annexed a well executed and life-like representation of one of the youngest though most extensive foundry establishments in this city. We have ever taken pleasure and pride in recording the progress of our manufacturing and mechanical enterprises, believing that next to the mines, they best represent the prosperity and permanence of San Francisco. The members of the firm of the Miners' Foundry have made the legitimate development and application of mining machinery to the special requirements of this coast, their close and careful study for many years, having been previous to their organization as a firm engaged as practical miners and machinists. Judging from the growth of this establishment, these gentlemen are entitled to great credit for the constant energy and perseverance which has characterized its management. From a very small establishment it has gradually risen, since its starting in 1859, to be one of the largest on this coast, and we believe in mining machinery it has manufactured more than any other.

The firm commenced operations in the month of December, 1859, in the center building as shown in our engraving. Their tools consisted of three second-hand lathes and one drilling machine; to drive these they had a small steam engine, the cylinder of which was only four inches in diameter. In the spring of 1862, they made a considerable extension to the rear; in 1863, a new extension was made by the erection of the building shown in the engraving, on the left; in 1864, a further extension was made by the erection on the right—each extension being accompanied by new and additional machinery—and now, in the spring of 1865, they are manufacturing and erecting for their own use some of the finest and heaviest tools to be found on the coast. From the perfection of their working arrangements, and the superior class of tools employed, we understand they are now prepared to undertake the construction of any class of machinery, however heavy or complicated.

Some idea of the amount of work which they turn out may be inferred from the fact that this foundry has now in operation, including their new tools, twenty-three lathes and eleven other machines used for drilling, slotting and planing. Their smith shop contains twelve forges and their cupolas, one of which is newly erected, are capable of melting twenty tons of iron per day.

This firm has just issued its "*Annual Circular*," which forms a work of sixty-four pages, containing, in addition to the advertisements,

[Concluded on page 169.]

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Metallurgy of Copper in California.

[By Paul D'Hibrry, M. D., Mining Engineer, Professor of Chemistry and Metallurgy, Superintendent of the Copper Mining and Smelting Company, Queen of Bronze, Oregon.]

NUMBER EIGHT—CONCLUDED.

FIFTH OPERATION — PURIFYING.

This operation is made in a small German hearth.

We fill the crucible with charcoal which we kindle; and then, on this kindled charcoal we place the bars of black copper, opposite and at the distance of an inch from the eye of the nozzle; we cover everything with a bed of charcoal of a foot in thickness, and we give the wind.

We cause the melting to go on slowly, and everything should be disposed in such a manner that the drops of metal, in melting, traverse the zone of combustion. In this manner the melting takes place in an atmosphere completely oxydating. It is requisite to have care to advance the bars towards the nozzle, in proportion as they melt. When the charge is entirely melted, we incline the nozzle, in such a manner, that the half of the wind comes to strike the surface of the melted metal, and acts as an oxydant upon the copper, whilst the other half, in making more active the combustion of the charcoal, will produce the high temperature necessary to the reactions.

There are formed scoria, of which the silica is furnished by the brasque of the crucible. The base of these scoria are the metals contained in the black copper. The oxyd of copper is also there combined in a large proportion.

These scoria are skimmed off in proportion as they are raised on the surface of the melted metal. When they cease to be produced, there remains but a very slight proportion of foreign metals mixed with the copper.

After the skimming off of the scoria, we continue the action of the wind, and bring the melted metal to a very high temperature, up to the moment when a quite active boiling is produced. When this boiling has ceased, the copper contains no more sulphur.

We cause to act in the same manner the air thrown by the nozzle, as it has been said above, until there is formed, in the melted mass, a notable quantity of oxyd of copper. In order to be assured of the fact, the purifyer takes samples, with a little iron spoon, lets it cool slowly, then breaks it in a vice. He considers the purifying as terminated, when the broken place presents a grained, dull appearance, and is of a brick-red or purple color.

At this moment we take away the charcoal, and we proceed to remove the copper in disks or rosettes, or we cast it into bars. This red color of the rosettes or of the bars, on the exterior and in the breaking, is a proof, for the purchasers, that the copper has arrived at a state of sufficient purity.

In order to take off the rosettes, we clear all the surface of the bath; we allow it to cool during eight or ten minutes, and we cast a little water on the surface. As soon as the boiling of the water has ceased, we take away, with a bar of iron, the solidified disk and we throw it into a basin full of water. We continue the same operation until the crucible is empty.

We see that the rosette copper is pure copper, mixed with a little protoxyd, which takes from it some of its ductility and malleability. In order to be fit to be rolled or be drawn into wire, it should undergo another operation in the same furnace, which we call refining, but which it does not enter into our plan to describe here; rosette copper being susceptible of an easy disposition in the market.

REACTIONS OF THE FIFTH OPERATION.

It is in the operations which precede the purifying that the substances injurious to the quality of the copper should be expelled.

In this operation the principal object is to take from the copper the iron and the sulphur which still sully it. In causing the zone of combustion to be traversed by drops of metal, in a state of fusion, then, afterwards, in causing the wind to act on the surface of the melted metal, it is proposed to form protoxyd of copper, and it is this protoxyd of copper which is the agent of purification. It yields, at first, its oxygen to the metallic iron, which passes, thus, to the state of protoxyd, is combined with the silica of the brasque, and forms scoria which come to the surface. Soon the protoxyd of copper, which is formed again, attracts the sulphurets of iron, changes them into protoxyds also, whilst there is formed sulphuret of copper. We see that the whole of these chemical reactions is equal to one series of double decompositions of the sulphurets by the protoxyds.

In fine, in the last period of the purifying, as soon as the protoxyd of copper has arrived to a sufficiently strong proportion, and the whole of the iron is expelled, it acts on the sulphuret of copper, and the sulphur escapes under the form of sulphurous acid. It is this evolution of sulphurous acid which produces the boiling of which we have spoken. If zinc, or lead, or nickel, etc., were present in the copper, they would act like the iron. The antimony and arsenic would form arsenates and antimoniates of copper, which would remain in the metal, and would make it lose much of its value.

We have arrived at the end of our task, but, before finishing, allow us some words further in reply to some observations which have been submitted to us.

We have not completely described the cupola furnaces, because the necessary instructions for building them can be found everywhere. We have contented ourselves with giving the dimensions, which differ from those generally adopted.

In Germany and in France these furnaces are higher than at Boston, that is to say, that the distance from the tuyere to the mouth is greater in the former than in the latter. This greater distance from the tuyere to the mouth produces an operation much slower. But if the ores contain much arsenic and antimony these substances are better expelled. With furnaces established like those of Boston—and they are of the dimensions we have given—the quantity of ore melted is almost double of what it is in Europe, in the same time. This method presents great advantages when we work ores of good quality.

We have modified the pressure of the wind in consequence of the difference which exists between charcoal and the anthracite used at Boston.

In fine, we have done without the reverberatory furnace, of which they make use in that establishment, for the purifying and refining. The motives which have determined us to make this modification are: because the reverberatory furnaces are very costly to establish; because the working of them requires very skilful workmen, and because, especially, without coal it would be very difficult, if not impossible, to obtain, successively, in the same furnace, a fire at first oxydating, and then reductive. The little German hearth keeps off all these inconveniences.

We have been asked, also, if ores yielding ten per cent. of copper, and which *would be always intransportable as ores*, would give a profit sufficiently important to be smelted with advantage? We reply affirmatively, especially if the vein-stone does not offer too unfavorable conditions—and they are favorable in California, where the vein-stone is always silicious or schistose. We have already said, in the commencement, that ores of this class could be very well worked.

Since it is desired, below are details based on the same calculations that we have given for ores yielding twenty per cent.

Six tons of ore yielding ten per cent. of copper would yield 1,200 pounds of this metal, worth twenty-five cents a pound, $300; which have cost, delivered at San Francisco, $138.38, leaving a net profit of $161.62, or $26.93 for a ton of ore. It is useless to add any remark in view of such figures.

It will be observed, however, that to work with profit this class of ore, it would be requisite to alter in some slight degree the arrangement of smelting works, that is to say, we would have two cupola furnaces smelting for matt (second operation) in order to feed constantly the rest of the works; the rest of the works would remain arranged as we have described it. We could produce, by this simple addition of a furnace, about 2,400 pounds of copper a day, the same as with ore yielding twenty per cent. It is scarcely necessary to say that slight alterations in the wind, in the furnaces, in the work, etc., will be very often requisite in practice, if we wish to obtain profitable results. It is for the experience and intelligence of the metallurgist, who directs the smelting works, to judge of the occasion of the alterations.

We need not say that the ores yielding an average of eight to sixteen per cent. must first call our attention, because they are the most common; those yielding twenty per cent. and over being the exception, *even in California*, and the result of a costing choice.

It has also been observed to us that in our calculations of Chapter IV, we have neglected 400 pounds of copper obtained at the smelting works, above the ton of this metal which figures in the transportation to San Francisco; whereas, on the other hand, these 400 pounds enter, in fact, into the price paid for the six tons of crude ore exported. We know, that, in making these 400 pounds of copper figure in the account, the profit of the smelting works would have been raised to that extent; but we have neglected them, not wishing to push to extreme limits the figures in favor of our opinion. We have wished to leave a margin for loss due to the difficulties inseperable from the commencement of every enterprise. In a word, we have not wished to make theoretic calculations, but practical ones. However, we ought to say that in a smelting establishment, working regularly, 12,000 pounds of ore, containing twenty per cent., should yield about 2,350 pounds of copper.

To describe minutely the process of reduction of copper ore which we have just shown to the readers of the Press, a large volume with plates would have been necessary, and such a work would have exceeded the limits of a weekly journal. Besides, as we have said before, we have not the intention of making metallurgists of our readers; we do not make metallurgists merely with books; it is before the furnaces, before the furnaces alone, that the eye learns to seize those fleeting, indescribable circumstances which serve as guides to the smelter, and which assure the success of operations.

We have, then, been content to show the route to follow, we have tried to light it somewhat, and this will be found sufficient, we hope, to arrive at the object which we have proposed. The enterprising spirit of the California people will do the rest, and will know how to take advantage of the inexhaustible riches which it possesses. If it did not do it, if alarmed by the follies into which speculation has drawn it, it abandoned the game, others would do it for them; others would find the way to profit by the labors done, and the discovery of the treasures which our mountains contain. The hint is given, nothing will stop the progress of this industry, and the copper mines of the Pacific States will, inevitably, take the place that belongs to them in the markets of the world.

[Written for the Mining and Scientific Press.]

The Problem of Gold and Silver Extraction—A General Review—No. V.

BY PROF. L. LANSZWEERT.

As already stated, a considerable loss of gold and even mercury occurs through the use of pyritous quartz, and where this is excessive and the richness of the quartz will justify, the quartz should be previously roasted in contact with steam, which reduces the sulphurets to sulphates, in which state they are inoxious. It is well known that by the old method of roasting such ores, there is a loss by volatization to a very serious extent, and by the treatment with mineral acids, salt, etc., another inconvenience is attained, the decomposition of a large proportion of quicksilver during the amalgamation, which at the end of the year is enormous and of a serious consequence. In 1857, Joseph Bartola invented and patented a method for desulphurising auro-pyritous ores by boiling them with pyroligneous acid or any other vegetable acid, which treatment in some instances, as corroborated by experiments, produce certain effects upon the sulphurets whereby the metallic gold liberated was easily amalgamated. The exposure of "tailings" from pyritous quartz mixed with two or three per cent. of salt to atmospheric influences for some time, then submitting the same to amalgamation, in some instances give satisfactory results. This oxydation of the sulphurets is a matter of deep concern to mill owners, and in this country where pyrites are so largely associated with the gold should receive their earnest consideration.

Many times the mills are in the hands of inexperienced persons, who have before them an occupation involving some of the nicest principles of mechanics, metallurgy and chemistry. The extraction of gold alone of this country is probably a more difficult and complicated matter than any other gold mining process in the world, since here in addition to the mineral subdivisions of the gold and the presence of iron pyrites are several native alloys or associated metals which destroy the vivacity and action of the mercury, and are impossible to be reduced by simple amalgamation. The inexperienced should recollect, that, to them, is now confided, not only their own fortune, but in a degree that of the whole country, since their general disaster will seriously delay the general advance in spite of the stability and extent of our mineral resources. They should be careful to secure the most reliable and scientific information in their power and apply it with rigid adherence to detail and economy. Thus, experience gradually gained without spasmodic fortune, will ensure their success beyond a per-adventure. The quartz on its delivery at the mill should be carefully inspected, and all wall rock, etc., rejected. Every mill should secure an exclusive source of pure water so as to be independent of the carelessness or criminality of others introducing grease and other deleterious substances into it. Allain and Bartenbach's process (comptes Rendus, 1849,) for extracting gold is applicable to all pyritous ores, even when the proportion of noble metal does not exceed two ten-thousandths. For working ores containing this quantity, the expense will be about $40 for every pound of gold obtained. The ore after being roasted in the air, is pulverised, made into a paste with sulphuric acid of 66° Beaumé and again roasted until the entire cessation of sulphurous fumes. The ore is now reduced to an impalpable powder, boiled with diluted sulphuric acid, and the undissolved residue digested in a mixture of six parts of muriatic acid of 21° Beaume and one part of nitric acid of 36° Beaume diluted with water. The gold and copper being in solution are then thrown down by iron, the precipitate calcined to oxydise the copper which is to be dissolved out with muriatic or sulphuric acid, and the gold washed, dried and smelted.

Lately, as a modification to Plattner's or Calvert's chlorination process, the following has been proposed appliable to poor ores, and especially to those containing a natural alloy of gold and silver rebelious generally to any other treatment. The process consists of roasting first the ore, then leaching the same with a *concentrated solution of chloride of sodium* saturated by chlorine gas. An ore treated as above and containing 1.24 per cent. of native alloy has left in the tailings no more than 0.019 per cent. Rock containing 0.19 per cent. of native alloy has left a residue of 0.002 per cent.

Mr. Brunfaut, in the "Journal des Mines," says: "The desulphurization of ores by superheated steam and heated air in cylindrical furnaces is objectionable on this account. The center of the fragments of ores often consisted of undecomposed sulphuret, but the desulphurization is perfect when worked in the following way. The furnace is filled with ore, mixed with ten per cent. of coke or coal. Superheated steam is now introduced for one hour and a-half, after this time the steam is shut off and heated air, by the aid of bellows, applied for the same length of time. The sulphurets have now a spongy appearance and are perfectly desulphurized." By this process all base metals are reduced to oxyds. silver and gold to the metallic state, and could then be easily treated by simple amalgamation in arastras, pans or barrels.

[To be Continued.]

The number of unknown persons who were found dead in New York last year was two hundred and thirty-seven.

[Written for the Mining and Scientific Press.]

Mariposa County Mines.

Editors Press:—In my last letter I gave an outline of my trip through the Merced country, from Coulterville to Mariposa, but there were some facts of importance which I was compelled, by lack of space, to omit.

One of the most interesting features of the geology of this region is a belt of limestone, some two miles in width, which crosses the Merced river, just below the entrance of the south fork, containing caves lined with feldspar, crystals and other phenomena common to limestone regions, but differing from any other that I have ever seen, in the form in which it exists, which is that of vertical strata, or laminæ, varying in thickness from one to three inches, often alternating with slate of about the same thickness. The bed of the river has been worn through this formation by the action of the water, and the polished ends of the broken strata striped with various brilliant colors, present a strange and beautiful spectacle. Some of the large boulders on the sides of the bluffs brought forcibly to my mind the appearance of the piles of armor plates in the yard where the monitor Cumanche was built, though of course on a larger scale, as the works of Nature always surpass in grandeur those of art. In many cases these masses were beat in various shapes, like plates of iron, which had been heated and struck with a large hummer. No description can do justice to this magnificent scenery; to be appreciated it must be seen.

There are several mines, also, worthy of note, which I had not space to describe in my last. Among these, one of the most promising is the

TEXAS MINE,

Situated in the bluff on the south side of the north fork of the Merced river, about a mile from that of the Messrs. Coward, of Coulterville. The vein is some twenty inches in thickness, and specimens of the rock, taken out at a depth of sixty feet, show a large amount of free gold. The owners have no mill, but expect to use one belonging to Mr. Coward, which is not now in use, until they have prospected their vein more thoroughly.

THE FERGUSON MINE

Is situated on the north side of the main Merced river, two miles above its junction with the south fork, and is in the common slate formation of the country. The vein is four feet in thickness, and has been opened to the depth of 180 feet below the surface. It is worked through a tunnel 220 feet long, extending to the font of the main shaft. The quality of the rock is very variable—some crushings averaging as high as thirty or forty dollars per ton, while the majority fall below ten. Thus far the mine, according to the statement of Mr. Ferguson, has not much more than paid expenses. The mill is small, containing one battery of five stamps, driven by an overshot wheel, sixteen feet in diameter, which is badly out of balance, making the motion of the mill very irregular. The rock from this mine shows little free gold, but contains immense quantities of sulphurets of iron and lead, which are believed to be also rich in gold. Another vein is now being opened by the owners of this mine, which promises well, though none of the quartz from it has yet been crushed.

About a mile and a half above this is the

RUTHERFORD MILL,

Owned by the Rutherford Brothers, one of whom was at the mill at the time of my visit. This, like the Ferguson mill, is a five-stamp water mill, and is almost worn out, but it has paid so well that its owners intend building a new and larger one during the Spring. The quartz crushed at this mill has been principally obtained from a vein near at hand, situated, like the Victor, in an isolated granite hill. This vein has been thoroughly prospected, and all the rock has paid well. Three tunnels have been driven in on this vein, each 200 feet in length, and from each has been obtained a large amount of rich rock. Another vein has been discovered higher up on the hill, from which the miners are now taking very rich quartz, none of which has yet been crushed, but which shows plenty of gold to insure profitable working if it holds out. A third vein, also owned by the Rutherford Brothers, is situated on the south side of the river, directly on the top of the steep slate bluff which here separates the main river Merced from the south fork. This vein is about a mile from the mill. The quartz is drawn down the hill by a mule in a sled, to the bank of the river, across which it is propelled in cars, over a bridge of novel construction. It was from this vein that the quartz was obtained on which the mill was employed at the time of my visit.

During the whole of this trip I was treated with the greatest kindness and hospitality by the owners of the various mills and mines. My thanks are especially due to Mr. Peck, of Peck, Fountain & Co., Mr. Ferguson and Messrs. Hite and Wynants, of Hite's Cove, for favors of a substantial character.

When I left Hite's Cove for Mariposa, on the morning of February 28th, the rain was falling rapidly. On gaining an elevation of about 500 feet above the river, the rain changed to snow, and by the time that I had reached the top of the hill, a distance of four miles from the Cove, the snow was four inches deep, and still falling rapidly, while a strong north wind, which was blowing at the time, contributed in no small degree toward making the journey an unpleasant one. Another mile brought me to the residence of Mr. Snyder, where I sought a refuge from the storm, which by this time had so increased in violence that it would have been next to impossible to proceed. An hour or two by his pleasant fire and in the society of his very entertaining family made me fain to accept his hospitable invitation to remain with him until the storm should be over, which, however, was not until the following day, when I left, hoping that the next time I was caught in a snow storm I might find an asylum with people as agreeable as those I was leaving.

On my arrival in Mariposa I met with a hearty welcome from Mr. Hammerstraud, who very politely assisted me in the object of my trip, taking me through the Mariposa mine and showing me other points of interest in the neighborhood.

The publishers of the two local papers, the *Free Press* and the *Gazette*, also, showed me every kindness and courtesy that I could express. Much as Messrs. Swaney and Lawrence differ between themselves on political subjects, they showed a remarkable unanimity of feeling in regard to the objects and merits of the Press.

On my arrival at Bear Valley, Pieper, the chief engineer of the Mariposa Company, took great pains to make me at home. I accompanied him in the company's carriage on a visit to the Pine Tree mine, some three miles from Bear Valley, and on our return received the offer of a saddle-horse to visit the copper mines of Hunters' Valley. This I gladly accepted, and on the following morning, accompanied by Mr. Dumars, of Bear Valley, I set out. A ride of seven miles, most of the way over a very good road, brought us to

LA VICTOIAR COPPER MINE.

We were shown the mine by Mr. Darqué, the clerk, Mr. Ponpion, the Superintendent, being absent on business of the company. I had intended to give a full description of this mine, but as Mr. Emerson, who is putting up smelting works at the mine, has already prepared one for publication in the Press, I shall allow him the whole field. There are several other companies prospecting for copper in this section, most of them with reasonable prospects of success. Among these, the Hammerstrand and Jenkins Companies are working on the same ledge, the latter commencing at the croppings and following the inclination of the vein, and the former commencing at a distance of sixty feet to the eastward, and sinking a vertical shaft, with the intention of cutting the vein at a considerable depth below the surface. To which it belongs, the law will have to decide, which decision will probably cost, before it is obtained, twice as much as the legitimate prospecting done by both. After leaving the copper mines we proceeded to Floyd's Quartz Mill, situated on Temperance creek, near the head of Hunter's Valley. Mr. F. has a vein of as fine quartz as I have seen anywhere in the State. In a pile of twenty tons it is impossible to pick up a piece that does not show gold. The vein is from a foot to twenty inches in thickness, and has been quite thoroughly prospected. Mr. Floyd is like many other miners in California, one who has heretofore been unfortunate, though his industry and perseverance have won for him the good opinions of all his neighbors, and they all rejoice at his good fortune. He had just completed his mill, which he expected to start in a day or two. The machinery of the mill is second-hand, and the whole shows evident signs of the struggle of energy and perseverance against adverse circumstances and scarcity of means. It has one battery of four stamps, driven by a small oscillating steam-engine.

After dining with Mr. F. we started in high spirits for Bear Valley. The horses, pleased at having their heads again turned towards home, pressed willingly forward, and the day seemed about to close in the most pleasant manner possible, when an accident of a very painful nature occurred to my companion. As he was riding over a rough piece of ground his horse stumbled and fell upon him, breaking his ankle and otherwise severely injuring him. Notwithstanding this painful accident, he remounted and proceeded the remainder of the journey, some five miles, without making the least complaint. On arriving at Bear Valley a surgeon was sent for, who set the broken bone, and the sufferer was doing quite well when I left. The general verdict of the people of Bear Valley, on hearing of the accident and his conduct afterwards, was, that where nerve was wanted, "Dumars would do."

The following morning I left Bear Valley for this place. Since my arrival I have been treated with the greatest kindness and politeness by the Postmaster, Mr. Hall. Hornitos is dull; I would write a further description of the place, but as there have been no changes of any account since the place was visited and described by one of the proprietors of the Press, I will not weary your readers by a repetition of that article, but will be content with assuring them that Hornitos still stands.

D.

Hornitos, March 10, 1865.

[Written for the Mining and Scientific Press.]

ON AMALGAMATION OF COPPER—A NEW RE-ACTION.

Messrs. Editors:—In working cupriferous silver ores by roasting and amalgamation, it usually happens that the silver obtained is more or less alloyed with copper, which is supposed to arise from the fact that in roasting such ores soluble salts of that metal are formed, which, dissolving in the pan or barrel, are reacted on by metallic iron, with precipation, and subsequent amalgamation of copper along with the silver. To obviate this inconvenience, various methods have been resorted to, all based upon the supposition that by decomposing the soluble salts of copper in such a manner as to produce oxyd of copper, the amalgamation of that metal would be avoided. Among these expedients are, using carbonate of lime in the furnace, the application of a high degree of heat, and the use of caustic potash in the pans.

The failure of these means to effect the object sought, in every instance, at least in which the amalgamation has been continued long enough to obtain all or nearly all the silver present, has usually been ascribed to their insufficient application; but I shall proceed to show that the practice is founded in error, and cannot therefore be successful.

Let any one place in a test tube some pure chloride of silver, some oxyd of copper quite free from soluble salts of copper, a little water, and a piece of clean iron. In the course of a few hours copper will be found in solution, and in time the whole of the silver, and, if oxyd of copper be in excess, a certain proportional quantity of copper will be found in the metallic state; the excess of oxyd of copper remaining unchanged I believe; the application of heat causes the re-action to be almost instanstaneous, and this takes place whether the oxyd of copper be the hydrate, precipitated by potassa, or the anhydrous oxyd, made by calcination of a copper salt; nor does the presence or absence of potash appear to affect it. (Probably a very large excess of the latter would prevent it, by decomposing the chloride of iron as fast as formed, if indeed it did not anticipate the action of iron, by converting the chloride of silver into an oxyd, in which case there might be danger of a loss of silver.) Again, place in a test tube some chloride of silver, a little water, and a piece of iron, and apply heat. In a short time a portion of the silver will be reduced to the metallic state, and the water will contain proto-chloride of iron in solution; decant this solution into another tube, add thereto a little oxyd of copper and apply heat; in a few seconds copper will be found in solution, and, if the heat be continued, a bulky, red precipitate will be seen which proves to be sesquioxyd of iron. If the experiment be repeated with the addition of metallic iron, this precipitate of sesquioxyd is nevertheless formed, while the iron is heavily coated with copper.

From this it is clear that proto-chloride of iron in solution re-acts on oxyd of copper, forming sesquioxyd of iron, and a chloride or chlorides of copper.

In repeating the first experiment with a solution of sulphate of copper supersaturated with ammonia, instead of oxyd of copper, it was found that the copper was not deposited until after boiling some time, and, when oxyd was used with the addition of ammonia, did not take place at all, while metallic silver of a beautiful white appearance was precipitated; a red powder, having the appearance of sesquioxyd of iron, was also seen. From this it would seem that the re-action between chloride of iron and oxyd of copper is not prevented by ammonia, but the final precipitation of metallic copper by iron is. Thus ammonia *may* answer the purpose of preventing the amalgamation of copper, but I fear it is too costly to be used for that purpose.

The precise nature of the somewhat complex re-actions which take place, cannot be determined without numerous experiments, both analytic and synthetic; but I suggest the following as being, probably, not far from the truth. Metallic iron first decomposes chloride of silver, producing metallic silver and proto-chloride of iron; the latter then re-acts on oxyd of copper, forming sesquioxyd of iron, and proto chloride and sub-chloride of copper; the latter is reduced by iron to metallic copper and proto-chloride of iron, while the proto-chloride of copper re-acts partly on iron, and partly on metallic silver, previously reduced, forming proto-chloride of iron, chloride of silver and sub-chloride of copper, the two latter being finally reduced to the metallic state by a further portion of iron.

Thus we have finally, metallic silver and copper, with chloride and sesquioxyd of iron. The diagram representing this equation is too complicated for your columns, but if any one will take the trouble to work it out, starting with 8 Ag, 12 CuO and 16 Fe, he will find that 865 parts of silver and 380 parts of copper, making bullion .695 fine, will be obtained at a cost of 448 parts of iron.

This proportion of iron is just double what would be required were no oxyd of copper present.

The hypothesis agrees very well with facts observed at Halsbrucke, where an average of fifteen pounds of iron is consumed for every five tons of ore, containing an average of eighty ounces of silver per ton, with one per cent. or less of copper; the larger proportion of iron in this case is easily explained, by the presence of soluble salts of copper in the roasted ore, which consume their portion of iron, independently of the above re-action. This also accounts for the fineness of the bullion being sometimes below .695. Another circumstance is the presence of chloride of iron in the roasted ore, which, in the case of a large quantity of oxyd of copper being present, would still further increase the quantity of copper finally obtained.

From the foregoing it would seem that where the proportion of silver to that of copper in the ore, is less than 2.3 to 1, there may be *some* advantage in decomposing the soluble salts of copper by potash, lime, etc., otherwise it is useless, as the oxyd of copper produced would be acted on as shown. As however, the object can be thus at best, only partially attained, some better way of effecting it is a desideratum.

I have not taken mercury into the account, as it ought not to be introduced till the chemical changes are in the main completed.

The above being somewhat hastily written on the eve of my departure for Mexico, is not so complete as could be wished, but may serve to call attention to a fact which appears to have been entirely overlooked heretofore.

C. A.

Water as Fuel.—The question is often asked why may not water, which contains such a large proportion of oxygen, be in some way economically employed as a fuel? The answer is obvious. Water is composed of hydrogen one part, and oxygen eight parts. In order to burn it, these elements must be separated. The most economical way to effect this separation is to bring the water, in the condition of steam, in contact with red hot coals. The decomposition is then effected by the affinity of the oxygen of the water for the carbon of the coal, with which the eight parts of oxygen immediately unite, leaving the one part of hydrogen free, in the form of a gas. The hydrogen, in that condition, is highly inflamable, producing a most intense heat. But there is exactly as much heat employed in decomposing the water, as is afterward generated in burning the hydrogen. Hence there can be no economy in the process, but a positive loss, in consequence of the incidental *waste* of heat in the operation. The operation is very much like a man's trying to lift himself by his wristband.

Fortifying in Canada.—A Quebec exchange says: "It is stated that the engineer officers at Quebec have privately communicated with several prominent contractors, asking for tenders for the construction of extensive fortifications here; and it is understood that tenders will also be asked for immediately for the construction of an entrenched camp and magazine, opposite Montreal, and of similar works of defease at other points. The Montreal *Evening Telegraph* says that these works, which are to be pushed forward without delay and with the greatest possible vigor, will be the means of affording employment to over 30,000 men, and cause the expenditure in the country of several millions sterling."

The Chinese.—Over one thousand Chinamen are employed in San Francisco in the manufacture of cigars, and they are beginning to swarm in other pursuits, to the displacement of white laborers and mechanics.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

San Francisco, Saturday Morning, March 18, 1865.

The money market remains without any material change since our last reference. The demand is fair, but considering the season of the year and the extraordinary animation of the share market, it cannot be said to be active. There has been rather more inquiry this week than last, but no change in the rates of discount, which rule steadily at 1¼ @1½ per cent. per month in Bank, and at 1½@3 per cent. for outside negotiations. The movement in stocks merely changes Bank balances from the credit of one dealer to that of another, without affecting the aggregate of deposits.

Receipts of Treasnre from the interior since Saturday last amountcd to some $850,000. The shipmeats of Bullion continue to Oriental ports, and Gold Bars are quotable at 840@850. Silver Bars are commanding ½@2½ per cent. premium for round lots of average fineness.

The stock market this week has exhibited considerable activity, and nearly all leading shares were well sustained, some of which have advanced materinlly. A better feeling pervades the Stock Exchange, and many dealers look forward to still higher prices. It must be conceded that the actual prodact of a number of claims has largely increased of late and that their future has never promised so well as now. These facts are of themselves sufficient to occasion the rise of the past few week, and to impart the strength the market now shows. But some of these shnres have been favorably influenced by other causes. Eastern parties have recently been buying largcly and without much regard to current quotations, thereby relieviag the market of considernble stock which might otherwise not have met with purchasers here. The money market, too, is easier than it ever has been, probably, on this coast, and speculative operators nre supplied by bankers and others with all the means they require.

City stocks are dull nnd trifliag sales were made, at full rates, however. Spring Valley Water Company was sold to the exteut of 150 shares, at 50⅛@50¾ per share, and Pacific Insurance Company was dealt in at $140. California Steam Navigation is offered at 80, exdividend of 2 per cent. paid on the 15th inst. San Francisco Gas is inquired for at $76 per share. Omnihus Railroad is in request at 109, and North Beach and Mission is held at 110. The Central Railroad Company have levied an nssessment of $5 per share.

Legal Tender Notes hnve been very active and nearly one-half million dollars have changed hands at the Board, declining from 54c to 52⅜c, rallying to 56c and closing nt 55¾c bid, 56 asked. The market is well supplied, hut large sums nre held by speculators, for a rise. Gold has fluctuated in New York between 190 and 164 since Monday last, and closed yesterday at about 172. The probable payment now of the gold interest—some $18,000,000—due in May next, on the 5-20 Boads of the Government, has doubtless influenced the current value of gold at the East.

Yellow Jacket steadily rose from $2,350 to $2,750, and closed nt $2,745 bid, $2,750 asked; 23 feet were sold. Advices from this mine continue to be of the most favorable character. The face of the drift rnnning south is said to disclose splendid ore, thus far, and is likely to continue so a distance of 200 feet further in the same direction. The compauy are employing some 12 mills, and their receipts of Bullion are increasing. A dividend of at least $100 per foot is anticipated for the month of March.

Gould & Curry is still in much favor, receding from $1,975 to $1,900, advancing to $1,960 and closing at about $1,940; small sales have been made. This claim has yielded an average of 120 tons of ore daily since the 1st inst. The company's mill reduces about 100 tons per day, includiag n small amount of tailings. The ore in the upper or old works of the mine is estimated at ten thousand tons, and this reserve, in addition to what has been found at a greater depth, will, it is believed, furnish all the ore required to keep up the present dividends for a long time hence, should future explorations develop nothing new.

Savage has fluctuated but little, and is well maintained; 21 fcet were sold, opeaing at $1.795, declining to $1,730, advancing to $1,775, aad closing at $1,780. No change has taken place in this mine during the week, aad the usual amount of Bullion is being sent forward.

Belcher was sold at $1,625, but is now in demand at $1,640 bid, $1,650 asked. The ore taken from the mine is yielding well, and a dividend of $75 per foot will probably be paid for the current month.

Crown Point receded from $1,350 to $1,300, thea rose to $1,450, and was sold yesterday at $1,500, some 20 feet changing hands. The compaay have employed the Phenix and the Marysville mills, and are now extracting some 60 tons of ore per day. As soon as the air shafts from the 230 feet level are made to connect with the level above, and additional hoisting power is in operation, the company propose to raise much larger quantities of ore.

Potosi has been activcly dealt in, and 137 feet were sold, advanciag from $885 to $1,025 buyer 30, receding to $930, and closing yesterday at $950. The pay lode in this mine at the 485 feet level, 200 feet south of the eagiue shaft, is said to be 27 feet wide, and thus far has been opened up a distance of 45 feet in length. In the cross cut, at the same depth, 80 feet north of the engine shaft, the vein, containing good ore, is 17 feet in width, aad continues to improve. Most of the ore now taken from the claim is from the upper levels.

Chollar has been quite a feature in the market, and 602 feet were dealt in at fluctuating rates, receding from $595 to $385, rallying to $435, declining to $390, rapidly advancing to $660, dropping yesterday to $475, advancing to $532½, and closing at $565. So far as we can learn, no material change has occurred in the mine; favorable indications have, however, been met within the past day or two in drifting for the 5th level.

Ophir was active and has been well sustained, owing in part to Eastern orders for nearly all the stock sold this week; 58 feet were dealt in, advancing from $415 to $450, and closing at about $430. Some of the officers of the company in Nevada have resigned.

Uncle Sam has attracted considerable attention, and 223 shares were sold, receding from $385 to $310, rallying to $320 and closing at $360. Overman declined from $350 to $300, and is now offered at $310. Hale & Norcross fell from $275 to $250, rose to $275, and sold yesterday at $265.

Bacon (G. H.) is held nt $250 per share. This claim adjoins the Empire on the north and is thought to be a very promising mine. The company own 45 feet of ground, a substantial mill of 20 stamps, capable of crushing 30 tons of ore per day, aad have recently incorporated iato 900 shares of stock.

Imperial is in decided favor, nnd steadily advanced from $148 to $175, closing yesterday at $173. Some 299 shares were sold within this range. The shaft has been saak 80 feet deeper than the lowest working level, and fine ore has been met with at that point. Receipts of Bullion the current month will largely exceed those of last month.

Bullion fell from $110 to $90 and rose to $110. Aa assessment of $30 per share was levied on the 11th inst. Buraing Moscow has vibrated between $45 and $27, and was sold yesterday nt $33; in all 2,641 shares were dealt in.

Daney declined from $40 to $20; North American fell from $43 to $25, and rose to $32; Sierra Nevada was sold at $22 and $24; Real del Monte nt $12, nnd Sheba at $18. Caledoaia Tunnel rose from $6 to $10. Wide West has advanced from $15 to $20 bid, aud Lady Bryau was sold at $10@12½.

The sales of Stocks and Legal Tenders, since Saturday last, nre larger than for nny like period in the history of the Board, and amount in the aggregate to $1,146,520.50.

Sales of the Week

How to Dress for a Photograph.

A lady or gentleman, having made up her or his mind to be photographed, naturally considers, in the first place, how to be dressed as to show off to the best advantage. This is by no means such an unimportant matter as many might imagine. Let me offer a few words of advice touching dress. Orange color, for certain optical reasons, is photographically black. Blue is white; other shades or toues of color are proportioaally darker or lighter, as they contain more or less of these colors. The progressive scale of photographic color commences with the lightest. The order stands thus: white, light-blae, violet, pink, mauve, dark-blne, lemon, blue-green, leather brown, purple, red, nmber, morone, orange, dead-black. Complexion has to be considered in connection with dress. Blondes can wear much lighter color than brunettes; the latter always present better pictures in dark dresses, but neither look well in white. Violeut contrasts of color should be especially guarded against. In photography, brunettes possess a great advantage over their fairer sisters. The golden tresscs loose all their transparent brilliancy, and are represented black; whilst the "bonnie blue e'e," the theme of rapture to the poet, is misery to the photographer—for it is put entirely out. The simplest and most effective way of removing the yellow color from the hair, is to powder it nearly white; it is thus brought about to the same photographic tint as in nature. The same rule, of course, applies to complexions. A freckle, quite invisible at a short distance, is, on account of its yellow color, rendered most painfully distiuct when photographed. The puff-box must he called in to the assistance of art. Here let me intrude one word of general advice. Blue, as we have seen, is the most readily affected by light, nnd yellow the least; if, therefore, you would keep your complexion clear and free from tan and freckles whilst taking your delightful walks nt the sea-side, discard, by all meaas, the blue veil, and substitnte a dark-green or yellow one in its stead. Blue tulle offers no more obstruction to the antinic rays of the sun than white. Half a yard of yellow net, though, perhaps, not very becoming, will he found very efficacious and considernbly cheaper than a quart of kalydor. The cause of freckles is simple enough. It is nothing more than a darkening of the salts of iron contained in the blood, by the action of light. A freckled face is, therefore, an animated photograph.—*All the Year Round.*

The Sheba Mine.—About two months since, the Trustees of the Sheba mine, of Humboldt County Nevada, concluded to stop the work until the indebtedness occasioned by the construction of a splendid mill could be fully liquidated, it appearing that coasiderable prospecting would have to be done before a supply of ore to enable the mill work to be resumed could be relied upon. Accordingly, a dispatch was forwarded to the Superintendent, and the work stopped. A careful examination of the mine has been since made, and the indications are so favorable that the Board have decided to resume work with the utmost energy. An assessment of $10 per foot has been levied to carry out this decision.

Suggestions.—A writer in *Notes and Queries* (J. Dixon) suggests that the line in *Hamlet*—"He is fat, and scaat of breath"—is incompatible with the line terming the melancholy prince "The glass of fashion and the mould of form." He thereupon suggests that "fat" is is a misprint for "faint." This is a new idea, but rnther a good one.

A large gray eagle with a bell round its neck lately made its appearance near Portsmouth, N. H. It was supposed to he a bird which was formerly a pet at Cape Porpoise, but which was sent adrift with a sleigh bell nttached to his neck, as a punishment for his frequent raid upon the chicken coops,

A Few in Luck.—Newspapers are not *all* in a starving condition. The three proprietors of the Chicago *Tribune* pay taxes on about $25,000 income each; Wilson of the *Journal* has an income of $24,000 and Storey of the *Times* about $24,000.

Probably 'he largest salary paid to any church singer in the United States, is received by a boy but twelve years old—Master Richard Coker, of Trinity Choir, New York. His salary is one thousand dollars per annum.

A philosopher was once consulted as to the best method of destroying one's enemy, and he gave for an aaswer: "Make him your friend."

Information Wanted.—A letter mailed at Nevada City, Cal., about January 28, 1865, signed by Jas. R. English, and addressed to this office, has failed to reach us, and we hereby offer a suitable reward for any information which may be given us of its whereabouts.

Sv10 **DEWEY & CO.**

The "Mining and Scientific Press" is an excellent journal, and ought to be subscribed for by every miner and artisan on the Pacific coast.—*Nevada Daily Gazette.*

The Inhabitants of the Stars.

Many writers have gone into the question of the probable stature, strength and configuration of our fellow beings in other spheres. Christian Wolff long ago fixed the hight of the inhabitants of Jupiter at forty feet eight inches. The Fourierists have more recently imagined a kind of celestial hierarchy in which the successive groups rise one above the other, in analogy with those of the lower universe, into which M. Renand has termed binivers, trinivers, quatrinivers, etc. The planets themselves have souls, and die out, as ours will do, to give place to newer forms of planetary life. Swedenborg, everybody knows, grew so familiar with the inhabitants of the several planets in which he was in the habit of spending his leisure moments of spiritual ecstacy, that he has left us but little to find out touching the moral and other characteristics of our brethren in those abodes. The feelings with which we, in turn, inspire those remote relations of ours—the lively warmth of Venus, the dignified calm of Jupiter, the sardonic calmness of Saturn. Science thus interpreted, points to a place for our souls among those radiant spheres. Transported among new conditions of existence, they may contract or put forth powers akin to those of the happier beings whose lot has already been cast there. And, as to what that lot may be, it makes the mouth water to listen to M. Flammarion leeturing us.

In an atmosphere no longer composed of oxygen and nzote, what ills of climate may not be spared those fortunate denizens! The whole pulmonary apparatus is doubtless modified, and with it the system of organic functions. Instead of the gross and steady plan of keeping up the bodily growth and warmth by food, liquid and solid, the degruding expedient of borrowing for that end the *debris* of other being, and, worst of all, that of killing and devouring those endowed with life, there may be a system of nourishing atmosphere, eomposed of elements nutritous in themselves, and capable of assimulation by organs of corresponding ethereal texture. In the general repeal of laws which belong to man's inferior state, that of labor may come in for the earliest abolition, and with it go all those vulgar cares, appetites and ambitions to which so much of the misery any *ennui* of terrestiul life are due. Vice will never have arisea. The origia of evil will offer no point for philosophers to wrangle over, for evil itself will never huve stepped in. Another law abrogated, or rather never set in foree, will be that of dcath.

War and violenee, exeess and deeay, being unknown in these happy regions, the idea of dying will be oat of the question, Peaee and right will reign undisturbed. The very faculties of the intellect will partake of the purity and the elevution of moral nature. The tedious and cumbrous process of experimeat aod observatioa will be replaced by a direct and transcendent vision of truth. It seems as if the limit of logic itself will be struek off as fetters from the spirit. The old problems insoluble here will seem perfectly eoatemptible. The eircle will have beeu squared there long ago, and philosophers' stoaes will be picked up by the roadside. The elixir of life, indeed, will be unknown, because, us we have secu, it will be superfluous. Art and seienee will enter upon new phases. Numeration will proeeed by such aovel and unprecedented process that we tremble to pronounce what two and two may be expeeted to make in M. Flammarion's developed process.—*London Saturday Review.*

It was a beautiful expression of Burks's upoa the death of his son, that his child in this world should be his aaeestor in the skies. Elder born in the glory—the juaior of the household is the senior in Heaven.

Ten years ago, Rufus Choate after passing an hour with Edward Everett in his magnifieent library, wrote: "He seemed to sit above all annoyances at the eenter of all reasonaals felieities, a happy and great character."

Edwin Forrest has in his house a small Theatre, the stage of which, he says, is as large as many on which he has aeted during a long career. This is intended for a school for the education of boys and girls in recitation and deelamation, and to fit for the stage all sueh as may have aoy ambition for that profession.

It is stated that within the last eight months, over four hundred aewspapers have eome to an uutimely end in consequeace of the exorbitaat priee of paper.

John Steele, the wealthiest man ia Pennsylvania, made so by oil traasaetious, (his reeeipts beiug three thousand dollars per day), died in Philadelphia, from injuries received from the kiek of a horse.

Size of Grass Seeds.—There are about 640,000 grains of the seed of orehard grass to the pound; of Timothy, about 1,600,000 grains; of Juae grass, 3,888,000; of Quakiag grass, 7,000,000.

Mechanical.

FACTS AND THEORY.

The party through whose means the following letter has been brought out for publication, being largely interested in various hydraulic operations at the mines, recently took occasion to make certain enquiries, the result of which he arranged in a tabular form, as given in the first three columns of the subjoined table of figures. The object thereof is sufficiently explained by the letter itself:

DEAR SIR:—You have furnished me the first three columns of the following table of facts obtained from practical men, who say they are the results of their experience in using water from ditches in the mines ("no theory and no humbug"), and you ask if it is possible to deduce from them a rule for calculating results. For the purpose of saving space, I add to your table other columns, hereafter to be explained and which I will designate "Theory."

	FACTS			THEORY.					
	Hight of Pens-stock, ft.	Diameter of Nozzle, inch's.	Miners' Inch's	Relative Hight	Square Root of Rel. Hight	Area of Nozzle	Miner's Inches	Theoretical Measure	Difference
1	225	1¾	162	450	21.2	2.41	50.97	111 03	
2	190	2	150	380	19 5	3.14	61.25	88.75	
3	100	1½	75	200	14.1	1 77	24.93	50 07	
4	150	2⅛	80	320	17.9	4.91	87.89	7.89	
5	130	2	75	260	16 1	3.14	50.97	24.03	
6	75	2	55	150	12.2	3.14	38.31	16.69	
7	240	1 3-16	28	480	2..9	1.11	74 21	3.76	
8	140	3	150	280	16.7	8.07	134 76	15.26	
9	130	two noz. ½ & 2½	180	260	16.1	3.14 3.97	40.57 63 92	74.85	
10	100	2¼ & 2½	200	200	14.1	3.97 4 91	54.97 69.23	75.80	
11	100	1½	80	200	14.1	1.77	24.93	55.07	

By comparing the third and eleventh of "Facts" you see the hights and nozzles are equal, and yet there are five inches differenee in results; and a hasty glance at the others, as first and seventh, or secoud and fourth, will satisfy you that sueh results eannot be true, or the facts have modifications not given. In the columns headed "Theory" I have given the relative capacities of "Gauge" and "Nozzle" and the data for aseertaining them.

The "miners' ineh of water," as I understand, is obtained from a square inch aperture made in a ditch or reservoir six inches below the surface of the water. It is generally estimated to furnish two and one-third cubic feet per minute. This is an over estimate as I will presently show you, hut need not be considered in making the above comparisou. Many experiments lead to the couclusion that water emitted from differeut apertures in pipes or cisterns, (*cteris paribus,*) have velocities varying within the sub-duplicate ratios of the distances of the apertures below the surfaee of supply. That is, if apertures of the same size, shape, &c., be located along a pipe at 1, 4, 9, 16, 25, etc., below the surfaee, then their relative veloeities will be 1, 2, 3, 4, 5, etc., times the first velocity, whatever that may be. For example: in the first ease above, the nozzle is located 225 feet below the guage, six inches below the surfaee, that is, the nozzle is 450 times as far below the surface as the guage, and consequently its discharge has a velocity of $\sqrt{450} = 21.2$ times as great. It will therefore take that many inches to supply it. As, however, it is supposed to have an area of 2.41 inches it will take $21.2 \times 2.41 = 50.97$ inches to supply it.

But, as generally, the sbape of the nozzle is better calculated for diseharge than the mouth of the guage, there should be an empirieal per centage added for this difference. Call this ten per cent. and the result would be, say fifty-six miners' inches, on about one-third of what is said above to be actually paid for. This per centage added will bring five of the above cases within reasonable differenees betweeu "Fact" and "Theory;" but the others vary so mueh that we must look for other eauses to explain them. These are all, doubtless, attributable to one cause.

In the rule as given above for ascertaining veloeities, you will pereeive how essential it is that the guage should be uniformly below the surface. Or rather that the surface be kept eonstantly at all times of diseharge, just six inches above the ceuter of the guage. For instance, in the first example above, if the surfaee fall to within one inch of the guage the nozzle would require fifty-two instead of twenty-one times the area at the source of supply. These facts carefully considered, I trust will answer your general query, hut permit me to add a word in relation to the quantity of water in a "miners' inch."

It was not essential for the above comparison between nozzle and guage or influx and efflux of water, but its mechanical power or working force depends of eourse upon the aetual amount of water emitted. A miners' inch is supposed to yield two and one-third cubic feet per minute. It is aseertained in this way. Water in eases like the above is believed to be governed by the law of falling bodies, viz: A body falls sixteen feet in one second and acquires at the end of that time an accumulated velocity of thirty-two feet per second. Its velocities at different distances below the point of test are in proportion to the square root of the distance. That is, one foot being one-sixteenth of sixteen feet, the velocity at the end of one foot's fall will be one-sixteenth or one-fourth of what it is at the end of sixteen feet, or eight feet per second. The miners' guage being half a foot below the surface or 1-32 of sixteen feet, the velocity is computedat $\sqrt{1\text{-}32}$ or 5.6 feet = 67.2 inches per second = 4,032 inches or 2 1-3 cubic feet.

In practice this is not found to be true. Although the principle is doubtless correct; it is modified by friction at egress, and by other causes, so much so, that two-thirds of that amount is perhaps nearer the truth. Consequently for efficient force or mechaniical purposes, a "miners' inch" should probably be estimated at about one and one-half instead of two and one-third cubic feet per minute.

THEORY.

A COAL OIL STOVE is among the latest productions of the inventive genius of the Eastern States. The patentee is C. H. Reichmanu, of New York eity. The objeet of the iuvention is to obtain a simple and portable stove, iu whieh coal oil may be eeonomically used as a fuel. Coal oil, as is well known, generates, burnt in a lamp for illuminating purposes, a great amount of heat, and where a draught ehimney is used a greater amount of heat is evolved or radiated from the lamp than when an open or no chimney burner has been used, iu consequence of a more perfect combustion being obtained with the ehimney burner. This iuvention consists in using with a coal oil lamp, of any suitable construction, a draught ehimney, and a draw arranged in sueh a mauuer that the heat evolved or radiated from the lamp may be advantageously employed for cooking or culiuary purposes. It eonsists further in applying to the ehimney a door and glass by whieh the lamp may be lighted and the flame regulated without removing the chimney from the lamp.

NEVADA INVENTION.—We see by the *Seientific American* that W. F. Stewart, of Austin, in the State of Nevada, is awarded a patent for a new and improved mode of working silver ores and saving amalgam and quicksilver, of whieh uo deseription is published. California inventors will find it greatly to their advantage to seeure their pateuts through the agency eonnected with the office of the MINING AND SCIENTIFIC PRESS, as thereby they will have a better opportunity of having their iuventions more promptly and eorrectly laid before the public.

DRILLING GLASS.—To drill a hole through glass, an anti-lubricating fluid should be used, such as turpentine, benzine or naptha. The same fluid will also give a bite to a file that will make it eut well for a while. In drilling through a plate of glass, it should be countersunk on the opposite side before the drill is allowed to pass through, to prevent sealing. The best tool for countersiuking is a drill dressed off at the point like a flat three-sided pyramid. It is very easy to drill a hole in common bottle or window-glass, but not so easy to perforate flint or plate-glass.

GRASS VALLEY FOUNDRY.—C. M. Taylor, owner of the Grass Valley Foundry, lately destroyed by fire, has determined to rebuild it immediately. The Grass Valley *Union* says the main building will be of stone, sixty by thirty feet in the clear. The foundation and walls are to he completed in eighteen working days.

SOME manufaeturers in Pittsburg are experimenting with a new process of burning coal in the manufacture of iron and glass, whieh eonsumes all the smoke. The coal is heated in a retort, and the smoke is mixed with atmospheric air at the poiut of combustiou by a peculiar draft.

THE YANKEES OUTDONE.—The thin sheet of iron produced in Pennsylvania and sent to England as "the thinnest sheet of iron yet rolled in the world," has elicited numerous competitors in that country, and has at last, we see, been signally beaten. The sheet sent from this country was the one-thousandth part of an inch in thickness. Two samples have been made; one, rolled from common iron in the ordinary sheet mills, by Messrs. Roberts, Williams & Co., of Swan Village, West Bromwich, is 1,015th part of an inch thick, is very tough, and has a good even surface. The other specimen, which at present bears away the palm, cousists of two sheets, measuring eight by five and a-half inches, weighing respectively forty nine and forty-nine and a-half grains, and being the 1,400th part of an inch in thickness. These marvelous examples of iron-rolling were produced by Messrs. Nevill, Everitt & Co., of the Marshfield Ironworks, Llanelly, Wales. The Yankee iron-masters will have to try again.

A NEW ELECTRO-MAGNETIC LOCOMOTIVE.—An electro-magnetic locomotive is being exhibited at Versailles, France, and attracting much attention from the *savans* of Paris. Its inventors, MM. Louis Bellet und Charles de Rouvre, think it can run with ease at 120 miles an hour. The model has four wheels; the drivers of copper, each carrying twenty horse-shoe magnets, so arranged that their poles pass through the tire, their polar surfaces being even with the tire. The current is from a fixed battery, whose wires run between the rails, and eommunieate with the apparatus on the locomotive, which makes and breaks the eontact. The iron rail attracts the polar surfaces. It is shortly to be tried on a large scale. It is claimed that it will be light, yet have sufficient adhesion in eonsequence of the attraction of the rails. The *Mechanics' Magazine* (January 6th) doubts whether it will be as cheap as a eoke locomotive, and gives at length its reasons for this view.

PATENT-LAW AMENDMENT.—The bill now before Congress—providing that an applieant for a patent, who has failed to pay into the Patent Office the balance-fee of $20 required by law to be paid within six months from the date of the allowance of his application, may renew his application on the original specification and model by the payment of an additional Government fee of $15—is likely soon to become a law. Our readers will be notified as soon as the passage of this very neeessary bill is completed.

FOREIGN APPRECIATION.—The Russians bave introdueed into their Government foundry at Petrozavodak, the American principle of casting heavy cannon—by eooling the inside by a current of water, as employed at Pittsburg, Penn. A fourth enormous eannon has already heen successfully cast at that foundry, on this prineiple.

SAFETY SWITCHES.—On the New Haven Railway there are some switches whieh are operated from boxes whieh ean be opened only when the switch is on the main track; heuce it is impossible for the switchman to go away from his post and leave the switch in such position that harm ean ensue. Whether he may fall asleep, or neglect his duty while in his box, our informant saith not.

TERRIBLE CONFLAGRATION.—A most terrible conflagration reeently occurred in Philadelphia, at which two thousand barrels of petroleum was burned. The fire was the work of an incendiary, and the inflamable material seemed to ignite almost instantaneously in all parts, as soon as the torch was applied. Rapid explosions were at first heard as barrel after barrel bursted, until the seperate reports were lost in one general roar of flame and combustion. Five squares of substantial brick buildings were destroyed. The oil ran along the streets in rivers of fire, overtaking and enveloping in flames many who were endeavoring to escape with their lives. The scene, with numbers of families running frantically hither and thither, shriekiug and calling for missing parents, children, brothers and sisters, was appalling. *Men women and children were literally roasted alive in the streets.* In one case a man barely escaped with his family, saving nothing but the dead body of his wife, who had deceased but a few hours previously, and whieh he saved by earrying her away in his arms, the fire even reaching and scorching her hair, as he bore her away from the rushing flames.

SPAIN, some three centuries ago, on account of her commerce, was the mistress of the seas; but want of attention to business education soon ruined her. Aspiring youths of America, learn a lesson from her, and take a course of instruction at the Pacific National Business College, conducted on the London Corn Exchange principles.

Dysentery.

Dysentery is literally a "difficulty among the intestines;" it is a discharge of blood from the bowels, accompanied with what has been aptly called an "atrocious pain." You feel as if you would be relieved by an evacuation, but when the attempt is made, there is a fruitless straining, termed *tenesmus*, and nothing comes of it, unless it be blood. The rectum, or last foot of the lower bowel, is the main seat of dysentery, which is commonly called "bloody flux." It should be always considered a dangerous disease. At first the discharges are odorless, but as the parts come more under the influence of the disease, they become disorganized, rotten, and insufferably offensive. Dysentery mostly abounds in hot, dry weather, and is oftenest caused by bad air, a sudden check of perspiration, or by whatever makes the skin of the body cold. In fact, dysentery may be considered an exaggerated or aggravated diarhea—the latter is water, the former, blood. The great distinguishing features of dysentery are bloody passages, with a frequent fruitless and painful effort to stool. It is one of those diseases which is very apt to go on to a fatal termination if let alone; a disease which is often made more speedily fatal by being ignorantly tampered with; and whether blood is passed from the bladder or the bowels, a skillful physician should be called in as speedily as possible—as promptly, indeed, as if it were an attack of cholera; but while he is coming, there are several things which may be safely done for the comfort of the sufferer, if not for his cure. The patient should not sit up a moment; should keep as quiet as possible; should eat absolutely nothing but boiled rice or flour-porridge, and swallow bits of ice to the complete quenching of thirst. A little cold flaxseed tea may be swallowed from time to time. A favorite prescription of some of the old physicians of a past generation, and which is now said to be in vogue in Russia for several forms of diarhea and dysentery, is the use of raw meat—thus, take fresh beef, free from fat, scrape it into a pulp with a knife, season it with salt to make it palatable, or with sugar for children, to whom begin with one teaspoonful three times a day, gradually increasing the amount as they become fond of it. Adults may use it by spreading it within two slices of stale bread. Its merits consists in its being easily digested, very nutritious, of small bulk, and readily assimilated to the system. It is well known that children, having the Summer complaint, will eat ravenously, or, rather, chew or grind between their gums, a piece of the rind of bacon or ham, to which is attached half an inch of fat, and begin to improve in a few hours. The whites of forty eggs "whipped," and then sweetened with white sugar, and drank largely through the day, without any food, is an admirable remedy in these ailments. Or for dysentery or protracted diarhea, take half a teacup full of vinegar, with as much salt as it will take up, leaving a little excess of salt at the bottom, add boiling water until the cup is two-thirds full, remove the scum, let it cool, and take one tablespoonful three times a day until relieved. It has not failed to cure in many hundred trials.—*Hall's Journal of Health.*

ABOUT GREAT MEN AND BOYS.—Among the mountains of California stand some of the most wonderful trees ever discovered. They tower up more than three hundred feet, or higher than the highest steeple in this country. There they stood hundreds of years before civilized man ever saw them. But they were just as grand while alone in the solitude of the unbroken wilderness, when only visited by the winds, the wild beasts and birds, and wild Indians, as they are now, when travelers flock to admire their stateliness. So all great men possess the same nobleness of nature that they do, after the world has discovered, acknowledged and applauded it. Those who long for opportunities of becoming great forget that greatness is in the man, not in the opportunity. The opportunity only gives occasion for greatness to exhibit itself. Washington possessed the same noble qualities when he told the truth and loved his mother, as when he headed the American armies, and presided over the councils of the nation. A man may be great, though circumstances confine him to a narrow sphere, just as a ray of light is as pure, as cheerful, and as much the child of the sun, as when flashing from the mirrors of a palace. Goodness, courage, devotion, manliness, patience, perseverence, reverence and love, will make a boy great, though he live on the most secluded farm in the backwoods. There are thousands of such boys, many of them will read these words for their encouragement. The day may come when their noble qualities will be wanted in the public service, and all men shall see and appreciate their worth. But if not, they are still rich in enduring wealth; and let them remember, also, that life only begins in this world.

MINING AND SCIENTIFIC PRESS.—This well conducted journa has entered upon its ninth volume. It it a sterling periodical, and deserves encouragement.—*Territorial Enterprise*

NEW METHOD OF PRESERVING FRUIT.

Several weeks since we made brief mention of a large house which had recently been erected at Cleveland, Ohio, for the purpose of preserving fruits, fresh and natural, by a new process, based upon the exclusion of air. We have since met with the following interesting description of both the building and process, which will doubtless be read with much interest. Will not some of the enterprising fruit dealers of California secure the erection of a similar institution in this city?—

The principle object is to absorb the vapors of the air; this is done by scattering over the floor chloride of calcium, a substance that has great power of absorbing the vapors of the air, thus removing all the moisture in the apartments. A wind wheel is placed on the top of the building which carries a current of fresh air into the apartments; this passes through the fruit, the oxygen being withdrawn from it, it produces a dryness among the fruit. In order to preserve fruit well it is necessary to have coldness, purity, dryness, absence of light, equality of temperature, and the exclusion of the oxygen from the air. These are all secured in this building. The thermometer stands at thirty-four degrees, and does not vary a single degree from this point during the year—or while the fruit remains to be preserved. The chloride of calcium is manufactured on the premises by the proprietors. It is made from a substance that runs from the salt works in Virginia, costing some six dollars per barrel delivered in Cleveland. Three barrels of this will produce enough chloride of calcium to preserve the fruit one year. The liquid obtained is boiled down to a hard crust, in large iron pans, then broken up and spread on the floor of the building; this is the grand secret of the success of the enterprise, and it was a long time before it was discovered. Mr. Nyce, one of the proprietors, has labored long to bring about the desired object, and he now thinks he has it to perfection. The building was not completed in time for early fruit. There are now in the building some 5,000 bushels of apples, six and a half tons of grapes and a large quantity of tomatoes, all of which are as fresh as when first gathered. I ate a cluster of Catawba grapes when there, December 27th, as plump and fresh as when taken from the vine. The apples and tomatoes were also fresh and free from decay. The building is capable of containing 11,000 bushels of fruit. The fruit now remains in rooms containing nitrogen and carbonic acid only. To show the writer the state of the atmosphere, a candle was lighted and a door opened into one of the apartments. In an instant the candle was extinguished. The apartments were shown by looking through a glass, but being so dark but little is seen. Those having the management know at all times the state of the atmosphere in the apartments, and hence are able to regulate the process correctly, as the air can be thrown among the fruits, or more of the absorbing agent put inside as occasion may require. The dampness and water that accumulate, run off, leaving no moisture in the rooms. There are seven feet of ice on the top floor, which will in the course of one year melt away about one-half. This leakage is also run off as fast as produced. The building has outer and inner walls of iron with an intervening space of three and one-half feet, which is filled with saw-dust and shavings, so that no air, heat or cold can enter through its walls. As far as the writer could observe, it is in all respects a perfect model of a Monster Fruit House. The design of the proprietors is to keep the fruit until the season of the year when none of the kinds are in market. The apples will sell in the months of May, June and July. The fruit thus kept is of a better flavor than when first gathered, as all the nice qualities of the fruit remain, and age makes it more rich and delicious. They were selling a few grapes for the holidays at forty cents per pound. Fruit in this building can be kept for years in perfection. It is a great enterprise, and one that should be encouraged. Messrs. Nyce, Shirk & Co., the proprietors of this establishment, told me they had made arrangements with parties to erect similar buildings in Detroit. There are only three of the kind in the United States, but they tell me that there will be several built at different points during the coming year. They believe it to be a perfect success. I should have mentioned that this house is one of the best places to preserve butter and eggs, or any substance of a perishable nature. It will pay any person to visit the Fruit House in Cleveland.—*Cor. Western Rural.*

A STATUE is about to be erected in Boston to the memory of Edward Everett. The area in front of the State House, opposite the Webster statue, has been suggested as the site for such a memorial. Upwards of $25,000 has already been subscribed towards the enterprise.

A MAGNIFICENT PROJECT has been set on foot by the merchant princes of New York. The plan is to present to the United States Government $2,000,000,000, and thus relieve the nation of the public debt. It is proposed to make the gift in 200,000 shares of $10,000 each, of which A. T. Stewart, William B. Astor and others will each take fifty shares, making up at least a quarter of the whole amount in New York. The realization of such a project would place both Government and citizens in a prouder position than over Government and citizens occupied before. History gives but one parallel to such an act, and that but a minor one, in which a rich merchant of Venice advanced the means to relieve the Venetian Republic from the pecuniary embarrassments visited upon it after a long and disastrous war, and placed it once more on the road to prosperity.

A VALUABLE NEWSPAPER.—The "Mining and Scientific Press," published by Dewey & Co., in San Francisco, is a useful and instructive journal for the miner and mechanic offering a vast fund of information respecting the working of metallic ores, the improvements in mining and other machinery, etc., etc. The PRESS deserves a liberal support from miners and artizans. Terms—$5 per annum, or $3 for six months.—*Placer Herald.*

Now in Its Tenth Volume!

— THE —

Mining and Scientific Press,

— THE MOST —

Profitable Newspaper

— FOR THE —

Readers of the Pacific Coast.

Issued Every Saturday Morning,

DEWEY & CO., Publishers.

Our Journal enters its TENTH VOLUME with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

We believe that the Press furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the MINING AND SCIENTIFIC PRESS substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,

An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders,
A Faithful Monitor for Stockdealers,

An Intelligenoer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to all Industrial Classes

Upon the Pacific Coast. We shall give accurate and frequent illustrations of new machinery and inventions.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News dealers, acting as our agents, will receive liberal commissions.

BOUND VOLUMES FOR SALE.

Rules for Advertising Assessments of Corporations on Saturdays.

Levy your Assessments upon any day EXCEPT FRIDAY.

Advertise the ASSESSMENT NOTICE on the FIRST FOUR SATURDAYS succeeding the day upon which the assessment is levied.

Appoint the day for advertising the DELINQUENT SALE on the FIFTH SATURDAY succeeding the date of levying the assessment.

Appoint the DAY OF SALE on the SEVENTH SATURDAY succeeding the date of levying the assessment, or any day *previous* to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

Blanks.—We furnish Secretaries gratuitously with correct blanks for advertising assessment notices, delinquent sales, postponements, etc.

DEWEY & CO.,
Publishers and Job Printers,
Office Mining and Scientific Press, San Francisco.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—Nos. 11 and 56 Government House, corner Washington and Sansome streets, San Francisco.

Information for Inventors!

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, oath, duplicate drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pencil-like sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attend a preliminary examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication, or in some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing the papers, conducting the correspondence with the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by conducting the case further. For this service we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the machine will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instructions, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application at the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or of a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-carvings, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3½ yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years....	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-Chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunc tion from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,
Mining and Scientific Press Office, Government House, corner Sansome and Washington streets, San Francisco.

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Saturday Morning, March 18, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Wm. R. Bradshaw—San Joaquin, Calaveras, Merced, Tuolumne, Stanislaus and Mariposa counties.

Mr. Robert Lattimore—Butte and Yuba counties.

W. H. Laws—Placer and El Dorado counties.

Thos. Poyzer, of Grass Valley, for Nevada county.

IMPROVEMENT IN MIRRORS.—L. P. Angenon, of New York, has recently patented an entirely new method of silvering or rather platinizing mirrors. The reflecting compound is prepared and applied in the following manner: "Dissolve two-thirds of an ounce of platinum, by means of heat, in two and a half ounces of muriatic acid and one and one-sixteenth of an ounce of nitric acid. Evaporate the acids; pulverize the mass, reduce with alcohol, and apply the solution with a brush to the surface of the glass. The glass is then heated in an oven till it reaches the cherry-red color, when it is allowed to cool slowly and the operation is finished." The whole process is simple and economical. It is said that the mirrors thus prepared are superior to those prepared by the ordinary silvering process—the adhesive properties of the new compound being stronger and the reflecting surface more durable and brilliant. The cost is said to be much less than by the ordinary process, and the application can be applied as readily to a large as to a small mirror. All who are acquainted with the mode of silvering mirrors, are aware of the extreme difficulty of preparing a large mirror without some slight defect in the reflecting surface. All this delicacy of operation, it is claimed, is obviated by the new process and perfection obtained in a large as readily as in a small plate.

QUICKSILVER.—Last week we saw Dr. E. F. Hough, of Martinez, take two ounces and nine pwts. of pure quicksilver from two pounds of cinnabar from the Welch lode, on Mount Diablo. The rock was smelted in a common retort (bolding one pound to a charge) placed in the bar-room fire. There is an immense deposit of cinnabar in the above-named lode, a portion of which is exceedingly rich. If worked to advantage, the cinnabar of Mount Diablo will soon prove one of the important resources of Contra Costa county.

OPEN SESAME ORE.—Five tons of ore from the lodes of the Sesame Company, of Clayton District, Contra Costa county, were shipped to this city on Wednesday of last week. The rock will soon be tested by working process, and we are quite hopeful that the Open Sesameites will receive a favorable return. Their several claims possess an abundance of mineral ore, showing, among them all, gold, silver, copper and cinnabar.

PLATINUM IN NEVADA.

There are parties now engaged in taking out platina on Cedar Hill, north of town. They crush and work it by horse power, down on Mill street, and we are told realize from five to ten dollars per day to each hand.—*Vir. Union.*

The term for designating the above metal is "platinum." It is often but incorrectly spelt "platina." This is the first time we have ever heard of any special working for this metal on this coast, although it is found in small quantities in nearly all the placer diggings. Platinum was first discovered in 1741 at the mines of Choco, Peru, by Charles Wood, a mineralogist officially connected with those mines, or as some say, by the Spanish traveler Ulloa in 1775. At all events the former gentlemen was the first to turn it to practical account.

Although the metal generally occurs in small grains, masses of some magnitude are sometimes found. A mass of 1088 grains was obtained by Humboldt in South America and placed in the Berlin Museum. There is another mass in the Museum at Madrid, measuring over two inches in diameter and weighing 11,641 grains. The most remarkable specimen, however, yet found was obtained in the Ural mines, in 1827, which weighed eleven and a half pounds. Platinum, we believe, is usually found in the drift of crystalline rocks, and never, that we are aware, "in place." We are curious to know how it occurs at Virginia City, and out of what kind of matrix it is "crushed" and collected. Russia affords about 800 pounds of platinum annually, from the Ural mountains; Borneo about the same amount, and South America about one hundred pounds. Small quantities are produced at several other localities. The entire annual product of the article, we believe, has heretofore fell short of 2,000 pounds. We are curious to learn what is now being taken out in Virginia.

The infusibility of this metal, and its properties of resisting the action of air and moisture and nearly all the chemical agents, renders it highly valuable for the construction of philosophical and chemical apparatus. One of the principal uses to which it is applied is in the construction of vessels for the concentration of sulphuric acid, as upon it that corrosive agent has no effect. It is extremely ductile, and can be drawn into a wire not exceeding two thousandths of an inch in diameter.

It was a long time after the discovery of this metal before it could be utilised to any considerable extent, on account of the difficulty of procuring it in large masses, or of compressing the smaller particles into a solid mass. This process was at first effected only by welding the small particles together, one after another, a tedious and expensive process. Dr. Wallaston, however, introduced the process now in use, which consists of dissolving it in nitro-muriatic acid, and throwing down from the solution a precipitate by means of muriate of ammonia. This precipitate, a double chlorid of platinum and ammonium, is then heated and thus reduced to a metallic state, when it assumes the appearance of a fine black powder, "spongy platinum." It is next compressed in steel moulds, by the aid of heat and strong pressure, and when sufficiently compact it can be forged under the hammer into any desired shape.

THE SOUTH STAR is the name given to a new gold mine recently opened in Grass Valley, about two and a-half miles west of town. They are now down 130 feet, with drifts opened thirty feet on each side. Some twelve tons of rock have been raised, which bears indubitable evidence of being very rich. The vein is from two to three feet in thickness. Thirty thousand dollars has been offered and refused for the vein as it stands. Another shaft is now being put down 150 feet north of the first. If the vein develops equally well in this shaft, it will take a much larger sum than the above-named to take the prize. We have seen some of the rock, which shows gold very freely, and presents the general characteristics of being highly auriferous throughout.

INJURIOUS EXCITEMENT.—We think there is a disposition in our community to rush into a frenzied excitement over the discoveries now being made of the existence of petroleum in various sections of our State. That there are rich and valuable deposits of this article, we have all the favorable external evidences that could be desired; yet, until demonstrated by actual operations, we hold there can be no sure evidence of an inexhaustible supply, and therefore we would counsel parties against making too sanguine expectations and investments. No matter how rich our State may be in oil or minerals, experience teaches our citizens that sudden and feverish excitements are not only ruinous to individuals, but hurtful, indeed, to the community at large. Indications of petroleum are ample, in fact, almost positive, for large quantities, yet we recommend moderate and thorough action in prospecting, and the good result will come in due time. A report has been put in circulation that oil has been struck in Colusi county, and was flowing at the rate of a barrel per hour, etc., all of which we have the best of authority for contradicting. The actual result was the flow of a few gallons only. Still, we have strong reasons to expect grand results from the oil fields of that section. The reported strike of oil at the Adam's well, we are also assured, was only a flow of some twenty or thirty gallons, probably from a crevice, giving strong indications, however, of a greater abundance, when a proper depth is reached.

THE OIL SPRINGS OF LOS ANGELES COUNTY.—We have received a call from Capt. Michael S. Wiseman, of Los Angeles, from whom we learn that considerable excitement exists, at the present time, in that region with regard to oil discoveries. We learn from Capt. W. that among the hills, which extend from the Santa Anna to the San Gabriel river, a large number of oil springs are found, the existence of which has been known for many years, and the product of which has of late been used for lubricating purposes, for which, it is stated, no better material can be obtained. Just below those hills, to the westward, the land is mostly held for agricultural purposes. It is upon these low lands that the ranch of Governor Downey is situated. A portion of the Governor's lands come within the limit of the oil region, and will, doubtless, prove very valuable. All the land that is supposed to be valuable for oil has recently been pre-empted; but a small portion of it was covered with grants. Capt. W. was among the first to locate a pre-emption claim.

ANOTHER CAVE.—Another tremendous cave has taken place in the Gold Hill mines, similar to that which recently occurred in the Gould & Curry. The extent of the cave may be imagined, when it is stated that the earth for fifteen or twenty acres, from the engine houses back beyond the American Flat grade, is much cracked, the fissures being from an inch to three feet in width, and some half a dozen acres in the immediate vicinity of the mines were sunk more or less to the depth of two or three feet. The cave was probably caused from melting snows saturating the earth at the surface. The accident occurred at half-past seven o'clock in the morning, when nearly one hundred men were at work, all of whom escaped up different shafts.

ANOTHER MINING SCHOOL.—Messrs. Kimball & Murphy, as will be seen by advertisement in another column, have opened, at their Metallurgical Works, on Bryant street, a "Practical Mining School," where gentlemen desirous of pursuing the study of practical metallurgy, will have every facility afforded them. Having, at their works, all the necessary appliances for crushing, roasting, amalgamating, smelting, refining, etc., a good opportunity is there offered of acquiring a practical knowledge of the various processes, as well as the analysis of ores, assaying both by the humid and dry way, etc.

A PROFESSOR of natural history, named Walker, writes to the English papers that the Channel Islands are gradually sinking into the sea.

GONE HOME.—J. Cummings Cherry, one of the oldest and most extensively known mining engineers and superintendents on the Pacific coast, left San Francisco by the steamer of March 13th for a journey to the East, in company with James Cherry, his son. They will visit their old home in Pittsburg, Penn., and doubtless review their "old stamping ground" with profit and pleasure, after an absence of several years, the elder Cherry being an old resident and expert prospector in the coal and oil regions of the Keystone State. Mr. Cherry has given much study and practice to the refining of coal oil and petroleum, and holds several patents and amendments for refining processes. We believe he has been the most successful party in refining the crude oils of this State, and are pleased to know that he has the utmost confidence in the richness of our petroleum lands. We learn that it is the intention of the Messrs. Cherry to issue a work, during their absence, on the theory of petroleum deposits, and the best methods of purifying the raw material. Such a book would be very desirable, and eagerly sought after by the many friends and acquaintances of the popular author in this State and Nevada. We are further told that the securing of proper works for refining petroleum is one of the main objects of their voyage East.

IMPORTANT IMPORTATIONS.—Any person who has never visited the store of Messrs. JOHN TAYLOR & Co., Nos. 512 and 514 Washington street, will be struck with surprise at the extensive stock of chemists' and assayers' utensils and wares there exhibited. The senior proprietor in the firm has been in this particular line of business for over twelve years, and having studied the wants of his patrons on this coast, is now enabled to present an assortment truly remarkable in variety and adaptation, and unrivalled by anything of its class on this continent. Prospectors will find a favorable opportunity of perfecting their outfit from this store. The House makes direct importations from Europe, and uses great diligence in keeping pace with the improvements of the times. Mr. Taylor is now on the eve of departure for the Atlantic States and Europe, with the intent of giving his attention to the purchase of the most desirable goods in the leading markets of the world.

WORTH MENTIONING.—The Summit of Zion Copper Mining Company, in Clayton district, Contra Costa county, have made a good showing of work for the amount of money expended. It is an incorporated company and commenced operations in May, 1863, since which time $4,000 only has been collected from assessments, and over 500 feet of tunnel, drifts and shafts have been run—tracks laid and shafts curbed. Besides this, a blacksmiths' forge and tools have been paid for, and the company remains comparatively free from debt. The lode has been reached at a depth of 230 feet, and the workmen are still drifting upon it. The ledge shows good ore, but not sufficiently concentrated to be valuable. J. F. Williams, Esq., of Martinez, is Secretary of the company.

GENERAL AGENCY. — We would call the especial attention of our readers to the advertisement, in to-day's issue, of Messrs. Tobey & Cutter. Both are men well known for stirring business qualifications and energy. Mr. Tobey was for several years successfully connected with the daily press of Sacramento, and for the past year has been engaged in the advertising agency business of this city. Those wishing to "buy or sell" can send in their orders or call at No. 28, Government House.

PATENT LIQUID SLATING. — We would call the attention of our readers to the advertisement of W. Holt, who has just received an invoice of "Patent Liquid Slating," for blackboards and slates. The application of the liquid is made to a smooth board with a sponge or brush, and after this coat is dry another is added, when the board becomes fit for use. It will be found a most desirable article for the purpose intended.

[Concluded from front page.

an extensive list of patterns, illustrations of mining machinery, tables of distances, valuable mechanical tables, rules and tables for estimating the power of steam engines and water wheels. The work also contains several valuable and well written miscellaneous articles, among which we may enumerate short notices of the various "Mining Districts on the Pacific Coast;" "Causes of Failure in Mining Operations and their Remedy," etc. The book bears the imprint of the MINING AND SCIENTIFIC PRESS, is well printed, upon good paper, and reflects much credit upon the enterprise and energy of the popular firm for whose benefit it is circulated. Copies can be had, free of expense, on application by letter, or in person, at the counting room of the Miners' Foundry.

One of the latest pieces of machinery brought out at this establishment, is an arrangement for weaving n supporting web of roping upon the outside of hydraulic hose. A specimen of the work of this machine may be seen at the store of Messrs. Tubbs & Co., No. 613 Front street, and also at the foundry. All who are engaged in hydraulic mining must be aware of the value of any arrangement sustaining the immense pressure to which the hose, employed in such operations, must be subjected. By the support given by this arrangement a single hose can be made as strong, or stronger, than a triplet, when used without any outside support. This support can be placed upon the hose at about one-half additional to the first cost of a single hose. The machine is the invention of Mr. Thomas McAuley, of this city, who has been long and extensively engaged in this class of mining. He has put his inventive genius to work for his own benefit, and thereby done a most signal service to this important branch of mining, and the Miners' Foundry is entitled to the credit of thus adding another new machine to the few really valuable one which have been devised to aid the miner in his laborious and intricate operations.

THE LUCKY.—This now celebrated and valuable Grass Valley mine still continues to turn out rich rock. The company has now about 200 tons on the dump. We have seen a specimen of very rich quartz taken from the end of the drift in the west tunnel, about 900 feet from where the mine was first opened. The vein at this point is said to be fully seven feet thick, and is quite as rich as at any portion of the mine yet opened. The Lucky boys are indeed in a rich streak of luck. May their luck never fail them.

IMPORTANT SALE.—We learn that the right to the entire Pacific coast for the manufacture and use of Linscott's Patent Chamber Drill has been purchased by Messrs. B. F. Sherwood, W. H. Godfrey and Isaiah Weston, for a heavy consideration, who are now making preparations for the manufacture of the same on an extensive scale. Of its merits we will speak more at length hereafter.

THE SANTA CRUZ PETROLEUM OIL COMPANY.—We understand that the work of boring on this Company's ground is progressing finely, under the energetic supervision of Mr. Sevenoaks, the Company's Superintendent. The indications for reaching the oil at an early day are all that could be expected.

L. P. MCCARTY, the most successful canvasser on this coast, intends soon to visit the interior of the State as agent of the *American Flag*.

OIL IN CONNECTICUT.—There is great excitement among the people of Connecticut over the reported recent discovery of coal and oil in the neighborhood of Hartford.

AT Winsted, Ct., a few days since, Thomas Powers was thrown fifteen feet across a room into a pile of scythes, by the bursting of a grindstone, and instantly killed.

REGISTER YOUR LETTERS.—In remitting cash for subscriptions to the MINING AND SCIENTIFIC PRESS, our patrons will please register their letters, and we will then be responsible for their reception. Parties remitting without registering their letters will do so at their own risk. The fee for registry is twenty cents, for which a receipt is returned by the Postmaster to the sendor from the party receiving the money.

MINING SHAREHOLDERS' DIRECTORY.

D. S. CUTTER. W. H. TOBEY.

PETROLEUM

ASPHALTUM and COAL

AGENCY.

WM. H. TOBEY & CO.,

San Francisco,

Having completed their arrangements with parties in the East, as well as those on this Coast, are now prepared to enter into the purchase, sale or lease of

PETROLEUM, ASPHALTUM AND COAL LANDS,

—ALSO—

COPPER, GOLD AND SILVER MINES,

LIBERAL advancements made on CRUDE PETROLEUM and COPPER ORES. We are also prepared to supply all BORING APPARATUS, TUBING, STEAM ENGINES, DARRELS for shipping Oil, etc., of the latest and most approved patterns.

Experienced Artesian Well Borers and help furnished at the shortest notice.

Persons at a distance wishing to send orders, receive information or subscribe for stock, will save time and money by communicating with us, as we are in constant communication with the most reliable houses and experienced persons at the East.

Parties owning Oil Lands or knowing where there are good prospects, will do well to write or meet us at our office. All communications strictly confidential.

We have now on our Books descriptions of Oil Lands which were selected by experienced chemists. Companies will be organized and incorporated under the laws of the State of California.

☞ *All business connected with Petroleum and Coal Mines* will be promptly attended to. Address

W. H. TOBEY & CO., Box 2021 Post Office.

Office, Government House, corner of Washington and Sansome streets. 11v10

N. LOMBARD INGOLS,

—or—

Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the

Mining and Scientific Press.

☞ Orders from the interior faithfully attended to. Packages which can be judiciously sent by mail will be prepaid at our expense.

A Deserved Compliment.—Soon after Gen. Sherman's arrival at Savannah, the Charleston *Mercury* paid the following high compliment to that distinguished officer:

"It is nerve that has carried Sherman to Savannah—it is that which is now carrying him to cut the Confederacy in half. His is an army of discipline—an army of soldiers—not a mob of ragamuffins. He has no generals with rolls of twenty or thirty thousand men, and twenty or thirty hundred in the field. His men stand to their guns—not to people's chicken-coops and barn-yards. His men are full in hand at their posts. He holds them there. He is a General."

As the *Mercury* has ever been one of the most violent of the Confederate sheets, the above may be considered as decidedly significant. That paper has since had an opportunity of preparing several additional chapters on Sherman's generalship.

Interesting Experiment.—A short time since the long talked of expeiment of exploding a submarine torpedo in an oil well, to enlarge its producing capacity, was tried in the "Ladies Well," on the Watson Flats, just below Titusville. The torpedo contained eight pounds of powder, and was applied at the depth of 463 feet. The explosion caused the oil and water to spout out of the well some thirty feet into the air, and made the ground groan like a great monster in the agonies of death. The flow of oil, water and paraffine continued for some ten minutes, when the disturbances subsided gradually, and oil appeared on the surface as fast as it could be dipped out with a sand pump.—*New York Tribune.*

BLASTING

POWDER.

EDWARD H. PARKER,

No. 224 California Street,

Agent of the

Hazard Powder Company.

EUREKA

Patent Blasting Powder

COMPANY.

Office, southeast corner Battery and Commercial streets.

Room No. 9, with San Francisco Chemical Works,

CHAS. A. JAMES.....AGENT.

For underground blasting in Tunnels, Mines, etc., this Powder possesses very great advantage—on account of it giving out scarcely any smoke after the blast. By using the same quantity in bulk as the gun blasting powder, you produce a much greater effect. 10v10qy

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties, on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

TO OWNERS OF MINES.

As many mines are being offered in the New York market, and as experience has proved that not one in ten of the titles are in proper form, we will state that the following is considered a good title:—

1. Copy of Notice of Location certified to by Recorder of District.

2. Certificate of Notary that A. B. is Recorder of District.

3. Deed of Power of Attorney from Locators to party selling, which deed or power of attorney must be recorded in the county in which the property is located.

4. Certificate from County Clerk that Notary and County Recorder is duly qualified.

C. A. CRANE,

9v10 Im No. 4 Cedar street, New York.

Silent Cities.

Oh, ye Silent Cities, how boundless in your lonely and solemn domain! In every clime, in every land, ye hold your dreaded sway. Your proud monuments stand in all their cold, dazzling whiteness, the sole surviving records of this world's wayfarers. Ye rear aloft your beauty and grandeur only to chill the heart with the memory of the lonely lips that are sealed forevermore. The rich and poor, the good and bad, the beautiful and deformed alike, are silent dwellers of your narrow homes

And we, can we enter your gates without an almost breathless awe creeping over us, without softening our careless tread and hushing our voices to a whisper lest we should haply rouse your slumbering trust, the pomp and glory, the pomp and misery of ages! Wandering through your grass-grown streets, may we not pause and weep amid all that remains dear to the dreams and affections? On the one side we find the monumental record of some loved parent called to a brighter home, and nestling close to it even in death the grass-grown grave of some little one gathered to its Father before it became ripe for this world's iniquities. Again we read the inscription of a worldling cut down in the midst of his vain career, and not ten paces distant a single oaken cross marks the last resting place of one of Earth's poor laborers.

And yet o'er these vast scenes of decay the sun shines as brightly, the birds sing as blithely as though there were no dead, and the fair flowers lift their blushing petals to kiss the dews of the morning, as though no aching hearts haunted the silent avenues of these cities of the departed.

Oh! ye Cities of the Dead, do ye not show us the emptiness of human grandeur? Have not one and all of your lifeless subjects passed to the judgment throne of Him who exalteth the humble? Ah! yes, let man but wander through your silent avenues to learn that this world's wealth is but an empty sound, whereas riches gathered for another world are stored where "neither moth nor rust doth corrupt, nor thieves break through and steal."

GOING INTO OPERATION.—The Pittsburg Paper Manufacturing Company have tendered the use of their mill at Steubenville for the purpose of testing the Austrian patent for making paper from corn husks, and the test will be made in a few days by the New York Paper Association, to which we alluded last week.

"A WORD TO THE WISE," ETC.—Parties in the Eastern States who desire positive information concerning the mineral wealth and developments of the Pacific States, should look for the same in some journal, published on this coast sufficiently truthful to enjoy a permanent circulation in the communities represented. Those credulous enough to patronize the mushroom bantlings of defunct California Jeremy Diddlers may expect to get "bilked."

WM. BRUCKNER'S
Furnace for Roasting Ores,

Now in Operation at 416 Market street.
This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron Cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most
Economical and Practical Invention.
The furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse power for the smaller size. Parties wishing to erect such furnaces will please communicate to
W. BRUCKNER,
5v10 No. 416 Market Street, San Francisco.

IMPORTANT INVENTION.
Hunter's Concentrator, Amalgamator and Separator.
For the concentration of Gold, Silver and Copper ores, and separating all kinds of metals from the sands, where the specific gravity of the metal is greater than that of the rock, a machine is now on exhibition at No. 521 Market st., above First, at BACON & WEBSTER'S Quartz Grinding Works, where it will be running from two to three o'clock P. M., for the inspection of all interested in mining. The inventor is prepared to manufacture machines to supply all orders promptly. The sixth of a horse power is sufficient to run one of these machines. For the above machine a patent has been applied for. Orders for machines, or for circulars and further information, should be addressed to
ANDREW HUNTER, Inventor.
The following extracts from Reports are submitted to the public as giving the results of a fair working test of these machines:

BEAR VALLEY, DEC. 12, 1864.
MR. A. HUNTER—*Dear Sir:* I take pleasure in stating, in reply to your request, that your concentrator has now been running uninterruptedly, at Princeton Mill, for more than three weeks, and the enclosed notes, by the Superintendent Mr. Williams, of a carefully measured test of its performance during a period of a day and three-quarters, I believe fairly indicates what it has been doing through the whole of that time. First, the loss of the sulphurets, per cubic foot of tailings from the Concentrator, was about one-tenth of an ounce. Second, the loss of sulphurets from the blankets was nearly *fifteen times greater* than that from the Concentrator. The Concentrator has not been found at any time in the slightest manner out of order, and has required scarcely any attention. Congratulating you upon the these facts, I am, sir, very respectfully yours, FRED. LAW OLMSTEAD,
Mariposa Company.

Notes of test run of Hunter's Concentrator—it having been supplied during the test with the sands reduced by one battery of the Princeton Mill, in the condition in which they are usually received by the blankets:—

Running time	1¾ days.
Amalgam saved on the plates of the Separator during above time, value	$6 75
Rate of saving of single machine per day	3 86
Rate of saving of six machines per day	23 16
Yield of Sulphurets, 1¾ days, pounds	215
Yield of Sulphurets, one days run of one Machine	123
Rate per day of saving from six machines, being the whole number required for the Princeton Mill	738
Yield of amalgam from plates of Separator, per ton of rock crushed, value	55
Yield of sulphurets from Separator per ton of rock crushed, pounds	18

HANNIBAL WILLIAMS,
Superintendent Princeton Mill.
SAN FRANCISCO, DEC. 18, 1864.
I have recently examined one of Hunter's Concentrators and Amalgamators, in operation at the Princeton Mill, Mariposa Estate, the sand and crushed rock, flowing from one battery of four stamps, passing directly over the machine, without using blankets. On examination, it shows conclusively that the loss of sulphurets by the machine is much less than by the blankets, being but a mere fraction of the sulphurets, consisting of the light and thin scales, such as can scarcely be saved by panning, while on the other hand the tailings from the blankets contain a large amount of heavy sulphurets. The product of the machine is almost pure, clean sulphurets—the copper plates of the machine, being amalgamated, securing much or all of the free gold that escapes the battery. I witnessed the cleaning up of the machine, and the collection of a ball of amalgam. From the weights taken we may state the constitution of this ore, as it came from the batteries at that time, as follows:

Clean Sulphurets containing free gold and amalgam	18.00
Quartz sand, waste	1981.78
Loss of Sulphurets and tailings	.22
Total	2000.00

WM. P. BLAKE,
Professor of Mineralogy, Geology and Mining, Mining and Agricultural College, California.
Hunter's Machine was Illustrated in the Mining and Scientific Press of December 24th, 1864. 3v10

APPOINTMENT.—Frank Soule, of this city has been appointed Collector of Internal Revenue. Mr. Soule is numbered among the earliest, most active and influentinl of Californin's Pioneers. He is a man of letters, ability nnd integrity. Being required, on a certain occasion, to givo evidence before the California Legislature, they. out of compliment, declined to place him under oath—his *word* was all they wanted. The public funds will be safe in the hands of such n man.

BOILER EXPLOSION.—The boiler of the Ophir company's hoisting works, at Virginia City, exploded early last Tuesday morning, demolishing things generally. By this accident the engineer, James Cameron, a native of Canada. wns instantly killed, and two other persons more or less injured. The explosion is attributed to a defective boiler and the carelessness of the engineer..

Machinery.

EUREKA

IMPROVED SELF-ADJUSTING

CLOTHES WRINGER,

AWARDED THE FIRST PREMIUM

At Oregon State Fair in 1864.

Abstract from Examining Committee's Report of the San Francisco Mechanics' Institute Industrial Exhibition of 1864:—

"CLOTHES WRINGERS.—A variety of these excellent Household Helps were found competing for popular favor.—Though none of them are entitled to a Premium, we consider the EUREKA, exhibited by M. E. Traver & Bro., worthy of honorable mention." [*Note*—No Premiums were awarded to articles of Eastern manufacture.)

The EUREKA CLOTHES WRINGERS are made superior to all others by the use of

PATENT ELLIPTICAL STEEL SPRINGS,

Which produce a UNIFORM PRESSURE upon garments of every size.

The IMPROVED EUREKA has the HINGE CLAMP, which will fit any tub or box perfectly. Its entire construction is simple and excellent. Every family should have one. It will soon RE-PAY ITS EXPENSE in saving time, labor, and clothes.

FARRAND'S
Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair
OF THE
Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN, W. T. GARRATT, H. P. WAKELEE,
O. OORI, GEO. JOHNSON, C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

E. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.

19v9

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

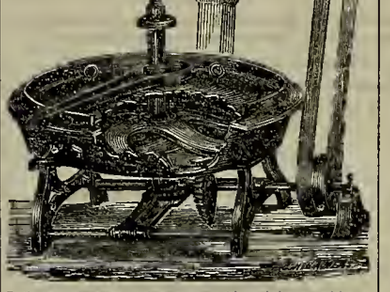
The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

PRATER'S
PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed



It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on wasle sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st. 1864. 14v8-tf

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Reiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

NOTICE TO MINERS.
NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, concentrate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, **B. FAUCHERY,**
Metallurgist. **Engineer,**

24v9

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

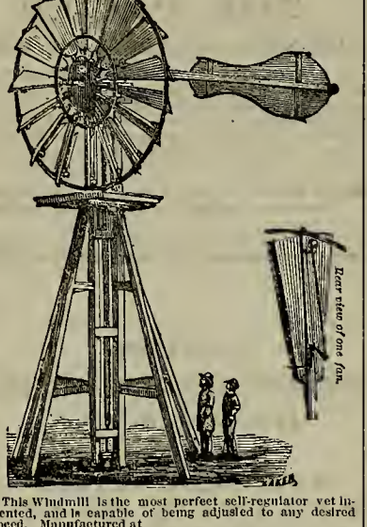
HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.



ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S
Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

Pacific
BEATER PRESS
Company.

SAN FRANCISCO, CALIFORNIA.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other

HAY AND COTTON PRESSES.

This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay, in dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.

The fact that Beater Pressed hay commands a BETTER PRICE in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.

This press is equally efficient for Cotton, Wool, Pulu, Tow, Hemp, Hair, Manilla, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties interested are invited to call and see one in operation.

Office and Warehouse—MISSION STREET, between Main and Beale streets.

W. H. MITCHELL,
2v10 **General Agent.**

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a stone or iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lumbaum, at Austin, Nevada:

No.	Fine		No.	Fine
Assay.....	250	Assay	300	990
Assay.....	286	Assay.....	941	Assay for Croman 960
Assay.....	266	Assay.....	940	Assay Water Rock 960
Assay.....	291	Assay.....	950	Assay Water Rock 998
Assay.....		.....		ft. Helena Ledge, W. D. 966

These, including a half-dozen other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

Disney's Cylinder Amalgamator,
The Cheapest and Best.

DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.
San Francisco, June 23, 1864. 1-3m

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

THE NOVELTY.

This ROTARY CYLINDER GRINDER & AMALGAMATOR *did not receive* the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up, and, in fact, is a perfect machine.

In offering his Amalgamator to the mining public the inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker on mining machinery, that there was room for improvement in that direction, and that he has, by careful study, invented his improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.

This invention consists of a cylindrical-shaped case placed horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller one or more placed within it, and covered with shoes one and a half inches thick, and so constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the Roman Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pulp in one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.

H. L. HOPKINS,

1v10 Inventor and Patentee.

DUNBAR'S
PATENT SELF-ADJUSTING
Piston-Packing.

Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.

IT WILL SAVE EACH SEASON MANY TIMES ITS COST in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this VALUABLE IMPROVEMENT, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,

23v8 Golden State Iron Works, San Francisco.

HUNT'S NEW DITCHER.

HAVING SECURED FROM THE INVENTOR THE SOLE right to manufacture these Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to

E. O. HUNT,

Windmill Builder, No. 28 Second Street and 110 & 112 Jessie Street, San Francisco. 9v22tf

New Mining Advertisements.

Alta Coal Mining Company, Clayton District, Contra Costa county, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 13th day of February, 1865, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Romeo Mauvais	7	100	15 00

Total		900	135 00

And in accordance with law, and an order of the Board of Trustees, made on the 13th day of February, 1865, so many shares of each parcel of said stock as may be necessary will be sold at Messrs. Edwards, Olney & Co.'s, No. 626 Montgomery Street, on the 1st day of April, 1865, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

A. MARTINON, Secretary.

Office, 311 Montgomery street, up stairs, San Francisco. mar18

Evening Star Gold and Silver Mining Company, Trinity District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 13th day of March, 1865, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 22d day of April, 1865, will be advertised on that as delinquent, and unless payment shall be made before, will be sold on Saturday, the 6th day of May, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

N. DUPERU, Secretary.

Office, No. 710 Sansome street, San Francisco. mar18

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 11th day of March, 1865, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, or to L. A. HAWKINS, Superintendent, at Silver Mountain.

Any Stock upon which said Assessment shall remain unpaid on Saturday, the 8th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 22d day of April, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

Office, Room 5, third floor, No 433 Montgomery street, San Francisco.

Notice is hereby given that at a meeting of the Board of Trustees of the above Company, held on the 11th day of March, 1865, Assessments Nos. 3 and 4, levied December 12th, 1864, were rescinded, and stockholders having paid said assessments will be credited accordingly.

mar18 J. WARREN CLARK, Secretary.

Harmon Gold and Silver Mining Company, Placerville, El Dorado county, California.

And in accordance with law, and an order of the Board of Trustees, made on the 17th day of March, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at Edwards, Olney & Co.'s, No 626 Montgomery street, San Francisco, on the 1st day of April, 1865, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

AUG. KUNAST, Secretary.

Office, No. 540 Washington street, San Francisco. mar18

Silver Queen Mining Company, Lander County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 13th day of March, 1865, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at No. 608 Merchant street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 15th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 29th day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

I. T. MILLIKEN, Secretary.

Office, 608 Merchant street, San Francisco, Cal. mar18

United States Mining Company, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 13th day of March, 865, an assessment of one dollar ($1) per share was levied upon the capital stock of said company, payable immediately in United States gold coin to the Secretary at his office, Nos. 8 & 10 Government House, corner of Sansome and Washington streets, San Francisco, California, or to JAMES V. COFFEY, No. 10 Taylor's Building, corner of C and Taylor streets, Virginia City, Nevada.

Any stock upon which said assessment shall remain unpaid on the 15th day of April, A. D., 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, April 29th, 1865, at 12 o'clock, M., to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

11v10 J. M. BUFFINGTON, Secretary.

Wilson Copper Mining Company, Garden Bar District, Placer County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 11th day of March, 1865, an assessment of $1 per share was levied upon the capital stock of said Company, payable on the 13th day day of March, 1865, in United States gold coin, to the Secretary, at the Company's office, No. 611 Clay street, Room 8, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 15th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 1st day of May, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

11v10 W. L. KIRBY, Secretary.

WARREN HOLT,

11v10-3m No. 305 Montgomery street, San Francisco.

PARTICULAR NOTICE.—Whereas Julius Silversmith persists in announcing himself as "late editor of the MINING AND SCIENTIFIC PRESS," we wish it distinctly understood that he has had no connection whatever with this journal for the past two years, or since it assumed its present form; nor has either of the present proprietors ever been, in any manner, associated with said Silversmith.

MINING PRESS.—The San Francisco *Mining Press* has entered upon its tenth volume, and bears evidence of increasing prosperity. Dewey & Co. have, by untiring industry, made the *Press* one of the leading papers of the State, and as a mining journal it has no superior in the country. Those interested in the mines on this coast can make no better investment of five dollars than by subscribing to this excellent journal.—*Alpine (Markleeville) Chronicle.*

THE RULING PASSION.—Since the late battles before Nashville, the boys of that city have taken up mimic warfare as their leading sport. A Nashville paper describes the sport as follows:

A few days ago, about a dozen of them agreed for a fight in Edgefield. After deciding who should represent the Federals and who the rebels, the former took possession of the hill, and the latter went down. After waiting sometime for Hood to attack the Federals, Thomas ordered a charge upon the rebel forces. Down the hill they rushed at full speed, each armed with a stick, when the Johnnies dropped, and the Feds, being unable to stop their headlong career, dashed into the rebel lines, and by the time they had recovered themselves, three of them were taken prisoners, but the army beiog then too small to cope with the rebel army, they were allowed to fight again. Thus the fight went on, with success to one or the other, until we were too far off to distinguish the position of the contending forces. Yesterday, some juveniles dug entrenchments near the capitol, sent out scouts, reconnoitered the neighborhood, were driven back, fired their arrows into the advancing foe, rushed out again to rescue their lost ammunition, back again to their breastworks, and thus continued, working like Trojans for an hour or more, until their mammas called them in.

SCIENTIFIC AND MINING JOURNAL.—This is as valuable a publication as is produced on the Pacific Coast, and one which interests all parties. It contains much that is instructive and entertaining, and seems to have the right men at the head of its affairs.—*Spirit of the Times.*

[ADVERTISEMENT.]

To the Public, and to Millmen in Particular.

As Thomas Varney has not, up to this date, withdrawn his notice in the "Mining and Scientific Press," in which appears the following language:—

"All persons are warned against purchasing machines made at the Miners' Foundry, called 'Wheeler's Amalgamators,' as they are an infringement on my patent, and a suit is now pending in the United States Circuit Court, against the parties infringing;"

In justice to myself I am compelled to give to the public a statement of the facts in the case, and show the position which Mr. Varney and myself occupy as Patentees. He commenced suit against me, and the Miners' Foundry, for $90,000, about the 1st of March 1863, and threatened suit against any and all persons who should buy my amalgamators, thus greatly damaging my business. To show the injustice of this suit against a "poor hard working mechanic," I will quote from the opinion of Judge Hoffman, as rendered in the case last November. He says:

This is an action for the infringement of a patent issued to the plaintiff on the 16th of December, 1862, for an "improvement in Amalgamators for gold and silver." The machine alleged to be an infringement has also been patented—the patent being dated December 8th, 1863. The defendants deny the alleged infringements, and the novelty and originality of the plaintiff's invention. They have also given notice, under the statute, of various other defences, hereafter to be noticed.

Models of the two machines were exhibited in Court, and a large number of witnesses called to explain their construction and mode of operation. It is apparent that the patented machine of the defendant closely resembles, if it be not substantially identical with, the improved and modified machine now manufactured by the plaintiff. But the inquiry is not whether Wheeler's machine resembles that lately used by Varney, but whether the former is substantially the same as the machine described in Varney's patent. That Varney has, in many important particulars, modified the machine as described in his patent, is obvious. Indeed, his late machines resemble much more nearly in external appearance, and in their mode of operation, the Wheeler patented machine than they do a machine constructed according to the drawings and specifications of his patent.

After describing Mr. Varney's pan and its operation, the Judge says:

It appears, however, that the idea of working ores in a batch, by causing them to pass repeatedly between mullers, the upper one of which is provided with openings at the center, is by no means novel.

J. E. Clayton testifies that, so long ago as 1845, he arranged a machine in Tallabeosa, Alabama, for the reduction of gold ores, which embodied substantially the same principle.

* * * * * * *

In Overman's Metallurgy, p 267, a similar arrangement is described. * * It is evident that the author is here describing an existing and well known machine, the uselulness of which has already been ascertained.

It is also apparent that the result aimed at is the same in this machine as in that of the plaintiff, and that the means adopted to accomplish it are substantially similar. In both machines the pulverization of the ore is effected by means of a bed plate upon which a muller rotates, with central openings to permit the pulp to pass continuously and repeatedly between the grinding surfaces until the operation is completed.

Amougst other things the Judge quotes the followiug from Judge Story:

But in all cases where the patentee claims anything as his own invention in his specification, Courts of law cauoot reject the claim, and if included in the patent and found not to be new, the patent is void, however small and unimportant such asserted invention may be.

* * * * * * *

Here the plaintiff claims a particular position of machinery as his invention, and it clearly appears in evidence that the position is not new. It has existed before—not in machines exactly like the present, but in machines applied to analagous purpeses, viz: in machines applied for the same purpose as the plaintiff applies them. Tho objection therefore, is fatal.

In the defendant's machine, tha pan in two parts, provided with flauges, packiug, &c., to which the plaintiff in his patent attaches so much importance, is not used, but a deep pan is substituted with a wooden covor.

The arraugement of the slots or shoes on the muller is different. The upper muller is provided with spiral ridges arranged to operate with similar ridges reversely inclined on the inner surface of the pan, to raise the pulp and promote the circulation. The upper muller is attached to the shaft by an universal joint, and by a mechanism quite dissimilar to that described by the plaintiff. And for the scrapers are substituted broad guide plates extending and secured to the edge of the pan, and capable of being elevated or depressed by means of a mechanism not found in the plaintiff's machines.

Assuming then—as in the point of view in which we are considering it we must—that each of the several parts of the plaintiff's machine is old, and not separately patentable, it seems clear to me that if the patent for the machine can be sustained, as for a new combination: which I think doubtful, the combination of the defendant is at least as novel as that of the plaintiff.

We have already seen that the muller rotating upon a bed plate, with central openings, and arranged in a pan so as to create a circulation of the pulp, is not a new invention. The tub, composed of two parts, with flauges, packing, &c., is not claimed to have been used by the defendant. In fact it is now discarded by the plaintiff, and a deep pan, with muller attached by an universal joint, has been adopted by him in his later machines. The infringement, if any, must consist in the use by the defendant of the scrapers described in the plaintiff's patent.

The inquiry thus arises—are the curved plates described in Wheeler's patent, substantially the same in their structure and operation as the scrapers of the Varney patent, and if so, do the latter constitute a "material and substantial part of the things patented by Varney, definably distinguishable from the other part." To determine this question, a brief description of Wheeler's machine is necessary.

The Judge then describes the Wheeler pan and the Varney pan and scrapers, and says:

In the Wheeler pan four plates are used while Varney employs only two scrapers. The form or curve given to these plates in both machines is similar, though not identical; but in their structure, arrangement, and the use for which they are intended, there is an essential difference. The scrapers of Varney are represented as of inconsiderable width, and extending from a ring at the center to the periphery of the muller—they rest apparently upon the surface of the muller, and no means of elevating or depressing them are mentioned in the specifications or exhibited in the drawings.

The plates of Wheeler are of considerable width, and attached to a frame suspended from the top of the shaft, resting upon a vertical screw, by means of which the frame and plates attached to it may be elevated or depressed. The plates extend to the inner surface of the pan, where they are secured by slides. The office of these plates, as described in Wheeler's patent, has already been mentioned. It appears to me that the scrapers of Varney neither serve, nor were intended to serve, any such purpose. [Here the Judge gives his reasons for the above opinion.]

For these reasons I am of opinion that the curved plates of Wheeler differ from the scrapers of Varney in their form and arrangement, their object and effect, and that therefore their use is not an infringement of Varney's patent.

Much testimony was taken to show that in fact Wheeler's invention was prior to that of Varney's and that the latter derived his ideas from the former

It is claimed by Varney that his invention was, in its essential features, matured and perfected in August, 1861. But this statement seems hardly consistent with his declarations or his conduct.

Varney's application for his first patent was not made until the end of October, 1861. That machine has since been discarded as useless.

If then, at the time of this application, he had already matured and perfected the invention of another and far better machine, he committed a practical fraud upon the public in withholding from them the benefit of his skill and ingenuity. It is certainly strange that he should have gone to the trouble and expense of procuring a patent for his first machine, and delayed, for nearly a year, his application for a patent for the improved machine which he had, as he says, already invented.

It may well be doubted whether, if it be true as Varney states, that at the time of his application tor his first patent he had already completed and perfected his improved machine, the suppression would not be fatal to both. It appears in evidence that, so early as December, 1861, Wheeler had conceived and communicated to Stewart & Kirkpatrick at Washoe, the idea of his machine. He explained to them the mode in which the circulation, or over and under current was to be produced, and the guide boards by which it was to be assisted.

In January, 1862, drawings of this machine were received at the Miner's foundry, and Stewart, the partner of Churchill, was desirous of having his pans constructed on that plan. The theory and construction of the preposed pan were fully explained to Varney, who succeeded, however, by affecting to consider Wheeler's pan a "bumbug," in dissuading the parties from adopting it, and in inducing them to order pans made on the model of his own patent. These were subsequently discarded as useless. We are driven to adopt one of two suppositions: either that Varney wilfully deceived Stewart in inducing him to order an inferior pan, or else that he had not at that time discovered the mode of producing the over and under current, recognized its utility and invented a machine to effect it.

Wheeler commenced manufacturing his machines in January, 1862. He commenced using them in June of the same year. They were constructed at the Miners' Foundry by the defendants to this cause, under the immediate observation of Varney. But in his conversation with Scott, in July, 1862, and in his communications with the defendants, he does not appear to have intimated that he was the first inventor of the Wheeler machine, and that in constructing the latter they were violating his rights. Up to the end of 1862, he continued to have his own pans built at the same foundry; and if he really considered the construction of Wheeler's pans to be an infringement of his own invention, his silence is inexplicable. His delay in applying for his second patent is equally unaccountable. In August, 1861, he had, as he says, completed and perfected his invention of his improved machine, and yet in October of that year he applies for a patent for his first and imperfect invention, and delays his application for a patent for his improved and perfected machine until the end of June, 1862—more than a month after Wheeler had taken the preliminary steps to obtain his patent.

It is unnecessary, however, to pursue this inquiry further, for in the view I have taken of the case the question of priority of invention is immaterial.

The Judge then notices the other grounds of defence, and says:

If this view of the effect of that statute be correct, it affords a defence to Wheeler as well as the other defendants. It is not pretended that he has used any machines not manufactured by them, or that he has infringed the plaintiff's rights, otherwise than by receiving from the other defendants the sum agreed to be paid by them on the sale of his machines.

I find, therefore, for the defendants.

[In this candid statement to the public, I should have preferred to have given the decision of the Judge and the findings of the Court in full, but for the great length of space they would occupy; and I will state that the same can be found in the "Mining and Scientific Press," of December 10th and 31st, 1864, and invite their thorough perusal.]

It will be seen by the above statements that Mr. Varney is infringiug on my patent right by the use of wide guide plates in his pans, instead of my infringing on his patent. The truth is, he never used any but narrow scrapers in his pans until after I had put my pans in operation, and they had proved a success. None of his pans made prior to the year 1863 ever ran six weeks without being condemned and thrown aside. This may account for the fact the he afterwards altered his patterns and made them like mine, with an open, deep pan, and wide guide plat·s instead of scrapers, and put a wooden cover on the pans.

Having established my right in my patent Amalgamator, it is now my turn to protect myself against the infringement of "Mr. Varney, or any other man," and I intend to do it; and all persons are hereby warned not to purchase or use machines called "Varney's Amalgamators," as made at the Union Foundry, Pacific Foundry, or any other place, as they will make themselves liable for an infringement on my patent right.

Having made some important improvements in my Amalgamaters, the public are invited to call and examine them at the Miners' Foundry, San Francisco, or at Prescott & Schiedel's Foundry, Marysville, where they are manufactured. ZENAS WHEELER.

San Francisco, Dec. 27th 1864.

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altegether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day are published as Serials, from week to week, in THE GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished talent in the Atlantic States and Europe; including "Orpheus C-Kerr," Fitz Hugh Ludlow, C. B. Densmore, "Mark Twain," Dan De Quille, Florence Fane, Miss Emma Hardinge, Sarah E. Carmichael, Annie E. Fitzgerald, "Cecasia Owen," Alice Mason, William Simpson, Chas. F. Stoddart, "Ina," H. C. Williston, "Albion," "Fairfax," Bonnevel, Mary Kyle Dallas, Margaret Hosmer, and many other accomplished writers of Fiction, Romance, Novels and Stories, Poetry, Essays, Sketches, etc., etc., comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

THE MINING AND SCIENTIFIC PRESS.—We call the attention of our readers to an article from this valuable journal, explaining some of the reasons why it should be supported. We have no hesitation in saying it is one of the most deserving publications on the coast, in fact, the only legitimate mining journal in California. Every practical pick and shovel miner, as well as every man who may be anywise interested in mining, should have the *Press* for his own information, aside from its scientific value. Its editors and contributors are men of practical experience and qualified to speak that which they know.—*Grass Valley Union.*

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.		Per ton.
12 per cent. ore	$24 00	22 per cent. ore	65 35
13 " " "	25 50	23 " " "	69 10
14 " " "	33 00	24 " " "	72 90
15 " " "	37 50	25 " " "	17 20
16 " " "	40 50	26 " " "	80 70
17 " " "	45 10	27 " " "	85 00
18 " " "	49 40	28 " " "	89 10
19 " " "	53 70	29 " " "	93 25
20 " " "	58 00	30 " " "	97 50
21 " " "	61 70		

To calculate the value of ore which assays 30 per cent. and upwards, multiply the per centage by $3.25, and you have the price which will be paid. For instance—suppose you have ore which assays 35 per cent.—multiply 35 by $3.25, and you have $113.75 as the value of the ore. These prices, we believe, will be found substantially correct, and can always be realized.

REMOVAL!

R. WEGENER,

Acccountant & Mining Secretary,

Has removed to

No. 415 Montgomery Street—west side,

Between Sacramento and California sts.,

6v10 SAN FRANCISCO.

REMOVAL.

The Office of the

Rose Gold Mining Company

Has been removed to No. 338 Montgomery street, Athenæum Building (Room No. 12), southeast corner Montgomery and California streets. [9v10-4t] C. M. PECK, Secretary.

Boot-Blacking Machine.

This late "YANKEE INVENTION" has arrived in California, and can now be seen

At the St. Lawrence Hotel, Market Street.

This machine is a great labor-saving invention, and will be found of especial value in large hotels, and for use at all boot-blacking stands, etc. The public are requested to call at the St. Lawrence Hotel and decide for themselves with regard to its merits, rather than to make up their minds as to its value from some peripatetic news-reporter, who may be a better judge of tangle-leg whiskey than mechanical ingenuity. Rights to use this Machine for sale.

IN THE DISTRICT COURT OF THE FIFTEENTH JUDICIAL District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk.
By G. C. LETCHER, Deputy Clerk.

C. Sims, Attorney for Plaintiff. 7v10-3m

American and Foreign Patent Agency

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICiently large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

DEWEY & CO., Publishers and Job Printers,

Office Mining and Scientific Press, San Francisco.

THE TOWN OF MARTINEZ.

One of the most delightful towns of our inland valleys, perhaps the most delightful of all, is the town of Martinez, situated across the river from Benicia. The mountain range through which the Straits of Carquinez have found their way, just below Benicia, so effectively break the force of the cold sea winds, as to produce a marked modification of the temperature on the two sides of the river at that point—the straits affording a free passage to the winds up to Benicia, while the mountains form an effectual barrier against their approach to the little valley, in which Martinez is located, and also to the entire chain of valleys with which it is connected, for quite a distance, along the various inland routes, diverging from that point. The sheltered condition of these valleys and their surrounding slopes, renders them most admirable locations for vineyards and fruit orchards. This climatic advantage appears to be duly appreciated, and all the available land is being rapidly brought into a high state of cultivation. Some of the finest wine in California is made in the vicinity of Martinez.

We have had the pleasure, during the past week, of taking a pretty extensive drive through this section, previous to which time we had never dreamed that in passing up and down the Sacramento, we had journeyed so near such a delightful paradise. Fairy valleys, grass covered hills, and mysterious gorges afford such a delightful and varied scenery, as to constantly excite the soul of the wanderer, in those labarynthian mazes of nature, to new ecstacies of delight and pleasure. It was in one of these moments of pleasurable excitement, that we suddenly came upon a most unexpected sight, even in such a locality—a grove of orange trees, in their richest robes of green, beautifully varied with clusters of snow white blossoms, and the rich yellow fruit hanging in great profusion from the bending twigs. On approaching still nearer, we noticed also, but without fruit, the darker green of the lemon, the bright leaved and pendant branches of the olive and the budding fig, just bursting into leaf. Our companion happened to be acquainted with the proprietor, Mr. John Strentzle, a gentlemen of Teutonic birth, and we could not resist his proffer to alight and make his acquaintance. The taste, skill and neatness everywhere displayed about his extensive grounds were quite sufficient, even before an introduction, to satisfy us that he was a gentleman of intelligence and worth. We spent a pleasant hour with himself and family, regretting that time did not allow us to accept his kind invitation to take an extensive ramble over his grounds. Of course we could not resist the temptation to take a closer look at his orange and lemon grove.

We brought away several fine specimens of his oranges, which he plucked from the trees, and which, although not yet quite ripe, are nevertheless of delightful fragrance and appearance; also a twig filled with buds and blossoms. He has some eight or ten orange trees, all loaded with fruit, nearly ready to pluck. He assures us that he finds no difficulty in raising them in the open air, although the frost sometimes nips the lemons, which are of more tender growth.

A NEW FRICTION MATCH.

The long sought for desideratum for manufacturing matches without phosphorous or sulphur, has obtained much popularity in Germany and England, as they are not only devoid of poison, but they are also fire-proof against any other friction except upon an especially prepared surface. Children may eat them with impunity, and they may be trodden under foot without the least danger of igniting. It moreover requires a heat twice or three times as hot as can be derived from the sun in the open air to ignite it. We have examined at the office of Dr. Lanszweert, 834 Kearny street, several different samples of these matches, variously improved, by him, upon the English and German style of manufacturing, for which letters patent have been solicited. We understand that the Dr. will introduce his improved manufacture to the public as soon as he can make some match, (financial we mean) to procure the necessary funds for establishing a manufactory.

The absolute elimination of phosphorus in the process of the manufacture of matches is truly a great progress, not only in point of the health of the workmen, who are now subjected to that terrible disease of the decay of the lower jaw bone, produced by the fumes of phosphorus, and the less risk of fire, but also in an economical point of view from the fact that the present manufacture of matches involves an immense waste of bones, necessary for the production of phosphorous. These bones may now be reserved for the economical purposes of agriculture. Few subjects are better calculated to arrest the attention of capitalists than the idea herein involved, as there can be but little doubt but that the phosphorous match will soon be consigned to the same darkness of oblivion to which the old fashioned tinder box and brimstone match has been so long assigned.

The California Coal Oil Excitement, at the East, appears to be rapidly on the increase. As yet, however, but comparatively few of our California capitalists have dipped into this new speculation with much earnestness. Our own people chose to wait a while, until they learn of some definite results from those now engaged in boring for oil. Probably a few weeks will prove whether the expectations of the adventurers on this coast are to meet with a success in any measure commensurate with their expectations. It will be well for persons of small means, at least, to await this result. There are now three large Eastern companies fully organized for operations in this State, one of which is already on the ground with a large portion of their machinery for boring. Others are in progress. The three first represent a nominal capital of $16,000,000, with $460,000 actually paid in, in gold, to be expended here. This sum will pretty thoroughly develop the interest on this coast, and whether success attends the enterprise or not, that amount of money will be put in circulation here in the effort. We trust, for the sake of our Eastern friends, as well as for the prospective benefit that would thereby accrue to California, that these adventurers may meet with success; but there will be plenty of time and room for investment after the first well has been struck.

THE COMSTOCK DRAIN TUNNEL.

We have already stated that a project has been set on foot for the construction of a drain tunnel, to take the water from the mines of the Comstock ledge, at a much greater depth than any tunnel yet completed. We have also, from time to time, reported progress upon the enterprise. The franchise, as is well known, is held by Mr. A. Sutro, a gentleman said to be well qualified to undertake the management of such an enterprise. Mr. Sutro is now in this city. He has fully matured his plans, counted the cost, and distinctly put forth a proposition for an agreement to be entered into between himself and associated capitalists, who are to construct the tunnel, and the mine-holders who are to be benefited thereby, and who are expected to pay an equivalent for such benefit. This proposition is stated as follows:

The undersigned proposes to form a Tunnel Company, with a capital of $5,000,000, the capital to be raised entirely or partly abroad, provided the different companies on the Comstock ledge will at the present time enter into agreements, binding themselves to pay to the said Tunnel Company, a certain amount to be agreed upon, and which will not exceed two dollars per ton, on every ton of ore raised and sent to the mills, after the said tunnel is completed and they are actually benefitted by having their mines drained.

The reasonableness of such a proposition must be manifest to all, and the wonder is that so liberal an offer has not been already closed with, and this important work placed in full process of active consummation. A work of this description will soon become an indispensible necessity to the successful and economical working of the mines on this ledge. Nothing is asked of the mining companies until the work is completed, and nothing then, unless paying rock is obtained, or at least it is not contemplated to put a tax upon any rock raised, except such as is taken to a mill for being worked; even then the tax proposed is less than one-quarter of that which the mine owners are now compelled to pay for pumping. We do not see how any reasonable person can object to such a proposition. It is but fair to presume that the delay in consummating this arrangement arises simply from a feeling of indifference. We cannot believe that any company would presume to hold out, with the hope that the work would go on without their coming in, so that they could reap the benefit at the expense of others, without any cost to themselves. It is to be hoped that early and united action will be taken in the matter, for it should be borne in mind that nothing can be done until all the parties interested are agreed. The value and importance of the proposed work can scarcely be overrated.

Singular Contest.—On the 22d of January, in Warren, Ohio, a twenty-two pound bull-dog, tackled an American Eagle, in a room twenty-four by fifteen feet, on a bet of fifty dollars. In less than no time, the National bird had the canine in a tight place, and as soon as he was able he broke away and fled for dear life. Another dog was then introduced, but the eagle made him weaken in about three minutes, and the contest closed. So it seems the American eagle can't be whipped.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Problem of Gold and Silver Extraction—A General Review—No. VI.

BY PROF. L. LANSZWEERT.

Before I close on the different treatment of gold ores, I may here yet mention a method to effect, by amalgamation, those ores in which the gold contained, although in the metallic state, is in particles so extremely fine, or minute, as to be scarcely, if at all, discernable by the naked eye; even in some specimens the gold is as fine as the dust upon a moth's wing, and generally known as *float gold*, which, by care, can be collected in proper tanks with the slime. These ores, if not already, should be reduced to an impalpable powder, then brought in contact and thoroughly moistened by a salt of mercury (nitrate or bi-chloride), placed in any kind of amalgamator, provided, however, the so wetted ore should be in contact with iron, which, by an electro-galvanic agency, causes the mercury to be thrown down in a bright silver stain (metallic state), it being an established and delicate test of the presence of mercury on solution that if a drop of a strong solution of bi-chloride of mercury (corrosive sublimate) is placed upon a gold coin or ring, the simple contact of gold with iron, as with the point of a penknife (through the solution) reduces the mercury to a metallic state, which readily adheres to the minutest speck of gold, and becoming, therefore, coated, so to say, with mercury. The mercury thus liberated adheres to the gold, forms a small particle of amalgam, brought in contact, subsequently, with any portion of metallic mercury, is dissolved in the same, from which, by compression and distillation, the gold is obtained.

It may not be out of place in this review to quote from the *Hydraulic Press* as to the various causes of the loss of mercury in the treatment of auriferous ores:

LOSS OF QUICKSILVER IN THE MINES DURING FROSTY WEATHER.

"Jack Frost has fallen so low as to enter the sluices of the gold-seeker and rob them of quicksilver and amalgam. He accomplishes his villainy by freezing the water remaining in the boxes at night, and causing the globules of mercury to adhere so tenaciously to the ice-crystals that a rush of water in the morning frequently sweeps off both together. This occasions a great loss to miners, even when there is no gold with the quicksilver. There is always some waste of the amalgamating metal, but in mild weather it seldom exceeds half a tank monthly to each claim. But we are informed of instances where the loss, owing to the cause above given, has been four tanks in three months, two tanks a month, and as much as two tanks in less than a fortnight. When quicksilver is worth one dollar, or one dollar and a quarter per pound, this increased wastage becomes a matter of considerable moment. In addition to all this, miners tell us that the gold yield during the winter season is always less in proportion to the quantity of dirt washed than in the warm season. When the temperature of the atmosphere is low, the mercury of course hardens, or condenses, and in that condition exerts its affinity for gold so feebly that the precious scales pass off unamalgamated, and many of them are lost. The effects of cold on quicksilver, as detailed above, are most plainly perceived in claims situated on the north side of a hill, where the sun seldom shines in winter, and ice lies unmelted until the warm summer days."

At present it is my intention to conclude this series of articles on gold extraction with a few brief remarks, namely:

1st. That the gold being generally disseminated in such fine particles through the gangue, quartz rock, or in the iron pyrites, that to effect its liberation the ores must be reduced to an impalpable powder, or, at least, to such fineness as it passes through an eighty fine screen.

2d. The pulp thus produced must be worked in the course of amalgamation *in the slowest possible manner*, to allow these minute particles to be brought in prolonged contact with the quicksilver, which should be tested as to its purity before use.

3d. That, if the quantity in the ore of sulphuret should be large, they should be exposed before amalgamation to any oxydizing influence, or any of the other methods already described, whereby the liberation of gold from its matrix should be obtained.

4th. In case the proportion of iron pyrites should be nominal, as the pulp is discharged in the amalgamators some common salt may be added, sufficient to render the water slightly saline to the taste, and thereby produce by its action an oxydation of the iron.

5th. Amalgamation—regularity and uniformity of labor are essentially requisite at this stage of operation—aided generally by heat. The pulp should be of a proper consistence, neither too thick nor too thin, avoiding grinding of mercury. Experience has proven that far better results are obtained by slow and regular action, that more gold will be obtained from two bushels of ore fed into an arastra in the course of an hour, one at a time, than would be derived from the same quality and quantity of ore if placed at once into the arastra and worked for the same length of time.

6th. To keep the quicksilver bright and active, the addition in the amalgamator of some wood ashes, freed from charcoal by sifting, will occasionally be advisable.

[To be Continued.]

From Our Journeying Correspondent.

MARIPOSA, MERCED AND STANISLAUS COUNTIES.

Editors Press:—A trip of two months brings me again to the initial point of my tour. During this time I have visited almost every mining district in Tuolumne, Stanislaus and Mariposa counties, and a general review of the state of the various mining interests of this interesting region, as they appear to a stranger, may not be out of place in your columns. At the head of these may be placed

QUARTZ MINING.

This branch of industry is now more extensively and successfully prosecuted than at any former time. The excitement on the subject is not so great as it was some years since, but the miners have acquired by experience the ability of judging more correctly of the value of a ledge, and there are consequently fewer extensive failures than formerly. In Tuolumne county this is especially noticeable, and the enterprise and energy with which mining is carried on in this county is a standing refutation of the idea that the mines of California are worked out.

In Mariposa county most of the rich mines are held by a single company, which fact has prevented that energetic, independent prospecting which has done so much towards the development of the mines in other parts of the State. Though, in justice to the Mariposa Company, it should be recorded that they have shown no lack of liberality or enterprise, still, owing to the impossibility of economical management in so extensive a business, they have failed to obtain a fair profit from their magnificent investment. Since the settlement of the boundaries of the Mariposa estate a new impetus has been given to prospecting in other parts of the county, and in the Sweetwater, Upper Merced and Maxwell's Creek districts many valuable mines have been discovered, and they bid fair to equal those of the most favorable localities of the State.

THE COPPER INTEREST

Has declined somewhat since last year, especially in Stanislaus and Tuolumne counties; more, however, from the expensiveness of prospecting than a want of confidence on the part of the people. The discovery of rich copper mines in Hunter's Valley has, however, revived that interest in Mariposa county, and it is to be hoped that by this time the prospectors have learned that to start prospecting for copper without capital is not worth while.

"PETROLEUM."

This liquid, which now feeds in the Atlantic States lamps of greater magic power than Aladdin's, has been discovered on this coast, and now everybody is beginning to snuff a new speculation which has a decidedly "oily" smell. The excitement on this subject in the neighborhood of Mariposa is very great. But the same difficulty as that which prevented the success of the copper prospecting a year ago, will probably interfere greatly with this; the prospectors have not sufficient capital. With very few exceptions, the persons interested in this speculation are very poor, and will not probably be able to carry the matter through.

Some of these companies have fine prospects. I was shown specimens of the crude oil from some springs in Fresno county, both at Mariposa and at Snelling's. Both samples had much the appearance of tar, and burned readily with a bright and beautiful light. There will evidently be great excitement on this subject during the coming year, and many fortunes will be lost and won in the wild game of speculation which it will inaugurate.

My journey from Hornitos to this place has been a pleasant one, but as it has been mostly through a farming region, there is little of interest to the mining reader.

At Mereed Falls I enjoyed the hospitality of the Postmaster, Mr. Nelson, who is much of an enthusinst on mining matters, especially on copper. I rode out with him to visit the Green Mountain Company's shaft, and I think the prospect very flattering. No copper ore of sufficient richness to pay for shipment has been found, but a strong uniform vein of mundic, three feet wide, with abundant "indications" has been opened to a depth of thirty-five feet, with well defined walls all the way down.

From Mereed Falls to Snelling's the road lies along the Mereed valley, the finest agricultural region I have seen in the State. I was particularly pleased with the permanent appearance of the improvements on the way. Brick and stone buildings, and fences of the most durable description meet the eye on every hand, showing that the farmers not only mean to make money, but also to make homes in this beautiful valley.

Snelling's is situated in the same range of sandstone bluffs as Knight's Ferry and Lagrange, but differs from them in the fact that there is here a valley a mile wide along the river between the bluffs on either side.

Fourteen miles across a monotonous sandstone country brought me to La Grange. This place has a tri-weekly mail and some business, though nothing like that it possessed in the golden days of long ago. There are a few "hydraulic" claims here which are paying well, but the mining, outside of these, is confined mostly to the Chinese.

This place appears much more lively now than at the time of my former visit, returning spring has spread the surrounding hills with her carpet of green, giving everything a pleasant and cheerful look.

Yours, wanderingly, D.

Knight's Ferry, March 16, 1865.

Massachusetts Items.—We clip the following from the Hampshire (Mass.) *Gazette*, one of the best mediums for New England items:

A "paint mine" has recently been discovered in the eastern part of Whately, owned by Elihu Belden, and near his house. Considerable ochre has been found, but the most abundant pigment is sienna, and the mine is, therefore, a valuable one. Mr. Belden is making arrangements to develop it fully. Another kind of mining is going on in the eastern part of Whately, where lead was discovered and work begun to obtain it in June of last year. The vein has been found on the farm of Myron Brown, who has turned the working of it over to some New York capitalists for a share of the profits. Two shafts have been sunk from 20 to 35 feet, and lead, in larger or smaller quantities, is taken out daily.

Go away with your "ile!" At the Loudville mines, recently, a lump of three hundred pounds of nearly clear lead was struck and disemboweled. Who knows but that oil will be reached there one of these days!

The Florence Sewing Machine Company, of Northampton, have received an order from Europe for 800 machines.

Recently, $60,000 of stock in petroleum companies was taken in Springfield, where they have "oil on the brain" bad.

Taking Cold.—A "cold" is not necessarily the result of low or high temperature. A person may go from a hot bath directly into a cold one, or into snow even, and not take cold. He may remain out in the coldest atmosphere until chilled through, and still not take cold. On the contrary, he may take cold by pouring a couple of tablespoonfuls of water upon some parts of his dress, or by standing in a door, or before a stove, or by sitting near a window or other opening, where one part of the body is colder than another part. Let it be kept in mind that uniformity of temperature over the whole body is the great thing to be looked after. It is the unequal heat upon different parts of the body that produces colds, by disturbing the uniform circulation of the blood, which in turn induces congestion of some part. If you must keep a partially wet garment on, it would perhaps be as well to wet the whole of it uniformly. The feet are the great source of colds, on account of the variable temperature they are subjected to. Keep these always dry and warm, and avoid draughts of air, hot or cold, wet spots on the garments, and other direct causes of unequal temperature, and keep the system braced up by plenty of sleep, and the eschewing of debilitating foods and drinks, and you will be proof against a cold and its results.

Petroleum gabble—well! well!

Construction of Our Ironclads.

BY OUR NEW YORK CORRESPONDENT.

Admiral Porter's report about the behavior of the monitors during the Wilmington expedition sets at rest all discussions as to their merits as fighting and sea-going ships. The splendid testimonial given to the Monadnock, the first in service of those monitors destined for coast defense—all those previously set afloat were intended for harbor and river defense only—shows again that in spite of all assertions to the contrary, which certain papers make, these vessels are a success.

The first batch of monitors, comprising the Passaic and class, (Camanche,) as well as the second batch, comprising the Mahopac and class, which were designed by Mr. Ericsson, have shown themselves in all actions superior fighting ships; it is true their hulls might be stronger, especially in a fore and aft direction, but each new vessel is in this, as well as other respects, an improvement on her predecessors. As they were not designed to go to sea in rough weather, it is not just to expect they should stand a storm as well as a ship designed for the purpose.

The Monadnock, built at the Charlestown Navy Yard; the Miantonomah, built at the Brooklyn Navy Yard, and now ready for service; the Tonawanda, building at the Philadelphia Navy Yard, and the Agamenticus, building at the Portsmouth (N. H.) Navy Yard, comprise the third batch of our monitor fleet. They are of wood and immensely strong, their frames are solid and from twelve to seventeen inches square. Their armor consists of five one-inch plates, backed by four feet wood. Close behind the iron there are the so-called armor stringers, set in the wood; they are wrought-iron beams five by seven inches, running all around the vessel, and thus increasing the thickness of armor above the water line to ten inches iron. Their deck armor is two inches thick. The beams forming the overhang do not run parallel with the deck beams, as in the other monitors, but run radial; the stern-post forms their center. The vessels are 250 feet long, fifty-six feet beam, and fifteen feet deep from ceiling to floors, having a displacement of 3,700 tons.

The accommodations for officers and men, as well as the system of ventilation throughout the ships, are superior to those of the smaller iron vessels of that class. These boats are equipped with two turrets each; the turrets are fifteen inches thick, twenty-two feet inside diameter, and weigh, with motive machinery and two fifteen-inch guns, over 240 tons a piece. The pilot-house is placed on the top of the forward turret. Their motive power consists of two pairs of back-acting engines, thirty inches diameter of cylinder and twenty-seven inch stroke of pistons. These engines drive two propellers ten feet six inches diameter, pitch increasing from thirteen feet six inches to fifteen feet six inches. These engines made on several occasions seventy-five revolutions per minute, giving a speed of eight and a-half miles per hour, after due allowance for slip on propeller, a speed superior to any ever made by any other ironclad of our navy.

These four vessels were designed by Mr. Sherwood, Engineer-in-Chief of the United States Navy. They form in their success certainly a most striking contrast to the so-called light-draft monitors, designed by another navy engineer. The Casco, one of those that had been altered by removal of turret, etc., etc., arrived from Boston lately; she made the trip from Boston to the Brooklyn navy yard in fifty-four hours; her engines made 150,600 revolutions, with steam pressure varying between twenty-five and thirty pounds, which gives her a speed of about three miles an hour. After her arrival at the Brooklyn yard a board of engineers held a survey on her, and, as rumor says, condemned her; the reasons were those faults in her construction which I pointed out some time ago. She is now only seven inches above water. When she left Boston she was almost two inches higher out of water. She will probably continue to settle till the heavy logs forming her raft have sucked in all the water they can, and consequently increased their weight accordingly. The Chimo and Nahant, two other ships of the same class, are also at the yard. No decision has been come to as regards them. H. H.

New York, February 14, 1865.

Flints may be melted—we see it daily; but an ungrateful heart cannot—no, not by the strongest and noblest flame.

It is a question whether "golden opinions" are worth any more now than they were before the depreciation of the currency.

[Written for the Mining and Scientific Press.]

Geology of the Mines at Campo Seco, Calaveras County.

Eds. Press:—In your copper mining summary of March 4th, you allude to the condition of Campo Seco in these words: "Up to this time, it is true, none of the claims have been profitable, but yet there is every prospect of ultimate success." Having visited that Camp a year since to examine its copper interests, and having detected then, as I think, the cause of their ill success, and as their own oracle, the Calaveras *Chronicle*, to which the above is credited, has thus spoken, thus opening the door to suggestion and criticism, I will state a few facts about the mines of that district which may possibly be of use.

You know that my view is, that the trappean rocks are the key of any system of mines, and moreover, that the belt of trap is limited in length, and therefore this system at Campo Seco is possibly entirely distinct from the Newton and Copperopolis system—those two last being distinct from each other, as it is to be seen in the fact that the Copperopolis veins have a serpentine for the foot wall country rock, while the Newton has a black talcose slate for its foot wall.

In walking over the copper mining ground at Campo Seco my first point was, if possible, to find this greenstone, talcose amorphous trap. That point being found, the solution of the mining problem was then comparatively easy.

This is the initial point of the system. I shall speak cautiously and rather suggestively, for my time then was limited to a few hours only, and, therefore, I have no right, without further extended examination, to speak positively; but my opinion is, and was then and there expressed, that their operations were not on a correct geological basis, and would not succeed until they by chance struck the true lead of copper ore; as by correct application of the principles of geology, the true lead of any system of mines is what is called a "contact vein," and was only to be found at the right topographical point of contact of the trappean and primitive rocks. They should so find it. All parties at work there, at that time, seemed so well satisfied with their own locations, prospects, labor and their geological knowledge, that I felt it might be deemed an impertinence, to criticise matters by a letter to the Press as I then contemplated, but as the remarks above quoted allow me to speak—they voluntarily having confessed their difficulties—I will make a few suggestions.

I think the key note to the system of mines there—the trap—is to be found immediately to the west of the Lancha Plana mine on which the steam works are erected, they having two shafts; however, they are—in those steam works—on the east side of the trap, whereas, the true ledge is to be found on the west side, several hundred feet, but further west, and although they may find copper in greater or less quantities, yet it would not be likely to pay, as it will probably lie in lenticular masses or pockets and bunches. It is also probable that at the shaft on the high hill right west, on which a windlass or whim was erected, it will not be found *except at a great depth*, although it is probable it is at the right point of contact of the two classes of rocks. The shape of the hill—the topography—is not right, as the ledge makes the hill and this hill is of a lean shape, showing that the ledge has not displaced the rocks; but I suspect it is to be found on the westerly side of the next hill, south, through the top of which hill, on its easterly side, a roadway has been made in the greenstone trap, as I deemed it in my cursory survey, and if I am correct in the character of the rocks, then the croppings or gossan is to be looked for on the westerly slope of the hill, at the point of its contact with a belt of primitive rocks next west. Since the ore always comes to the surface in shoots or chimneys, and appears once in about 1,500 feet, it would not appear in the next hill north, where the whim is, but is deep down under it, and to be looked for in the hill on the same line northerly and a little west at the right opening in the rocks.

The Campo Seco Company, if I remember aright, are several hundred feet further east on the gulch, and work their mine by a water-wheel. The mine lies in talcose slate, on both sides, and hence is a fissure vein and must be worked with reference to that fact. The history of all mining, whether of gold or copper, when the veins lie with this class of rocks on both sides is ultimate failure, for the reason that the ore lies in lenticular masses and is limited in length and depth. Such is the history of the unsuccessful gold mining of Amador county, and of the Alleghany Mountain gold fields.

Now the failures do not arise so much from the want of good paying ore, for this class of gold mines often pay much better than the true mine, but that when there is any cessation in the supply of rock, tunnels are blindly run in various directions for the continuation of the ledge upon the supposition that it is broken or that it is dislocated by a "slide"—that convenient immeasurable last argument of miners—using up time and money uselessly drifting for the ledge, when in reality there is no continuation to the ledge. These fissure veins being local and disconnected, although they doubtless had their origin from the main vein or mother ledge of the system at the time of the original upthrow, but now have no direct connection, the bottom of these veins being usually split up and scattered among the slates, and when so scattered it is of but little use to follow them any farther with hope of profitable working.

These remarks apply not alone to the Campo Seco copper mines, but I found the same mistaken (as I deem) direction of labor in every camp that I visited. Hence if my views are correct, prospecting, a merely blind hunt for ledges, is measurably an absurdity, nature having defined to the educated eye the localities where her treasures are almost unerringly to be found, and therefore, until we master these facts she has so plainly written on the rocks for our guidance, our mining must continue to be empirical and uncertain.

In your correspondence of February 11th, from Chinese Camp, your correspondent "D" suggests that some of the miners of that section would like to have discussed the subject of the comparatively reliability of gold-bearing ledges in granite or slate, and would be happy to furnish geological data now in his possession as a basis of discussion. I would be happy to discuss the matter with them or him, but the prime difficulty is to be able to be positively certain that what they or he might call granite or slate, etc., is indeed granite, etc. It would be a source of gratification to myself to learn the position of the limestone of which he speaks. It is more properly to be considered a marble—relative to the quartz ledge and the surrounding rocks, and also the real character of those rocks for a mile, say on a line easterly and westerly, at right angles with the plane of the rocks, for by this collection and disension of facts we may be able to educe principles which may greatly aid us in our mining researches. Specimens of the rocks themselves, carefully labelled, with full description, depth from surface, etc., would aid greatly in arriving at a correct conclusion.

O. W. Easton,
Geologist and Mining Engineer.
San Francisco, March 12th, '65.

It is now well ascertained that most of us eat twice as much as we need, and that ninety out of a hundred diseases are of our own making. The gentlemen who whirl about in earriages as if they were running to put out a fire, passing from house to house to minister to people afflicted with colds, bilious attacks, headaches, nervous complaints, gout, rheumatism, and the majority of physical ills that afflict humanity, owe their occupation and its profits to the "wrongs of the stomach." People treat that vital member, which prepares in its wonderful laboratory the streams of life that nourish the whole system, as if it was merely a convenient arrangement for the gratification of the palate and the appetite. As a rule, they don't even take the pains to lighten its labor by making their teeth do the rough part of the work, but bolt their feed, gobbling away as long as a cubic barley-corn of the stomach is left uncrammed. They convert it into an organ of sensual enjoyment, forgetting that its office is to prepare supplies to repair the hourly waste of the body, and that, as these supplies are healthy or unhealthy so will the body be.

Oil Rises.—Neither the increasing discoveries of oil at the East, nor the stories in circulation there with regard to the wonderful discoveries of that material in California, appear to have any effect to depreciate the prices. Coal oil has advanced from thirty-five and forty cents per gallon, wholesale, to eighty cents, and will doubtless be up to one dollar in a short time.

At a recent meeting of the publishers in Pennsylvania it was stated that when the war broke out printing paper was only 7½@9 cents a pound, and now it is worth 29 cents. While the price of paper has increased 200 per cent., the cost of manufacturing it has increased only 50 per cent.

Selected Recipes.

Cold Cream.—We offer the following receipt for cold cream because it is really "cold" and soothing to an irritable skin: Procure perfectly fresh lard which has never been touched by salt; wash it thoroughly in spring water freshly drawn, and do this in three different waters; then leave it to soak in fresh water and in a cool shade for twenty four hours; then wash it once more and beat it until it becomes a cream in as much rose water of the stronger sort as it will absorb in the process of beating. When finished the rose-water will have penetrated every part, and should stand in little pools here and there on the soft, porous-like surface.—*Genesee Farmer.*

To Clean Carved Ivory.—Wash with white soap and water, not very warm, and after rinsing it by pouring cold water over it, wipe it slightly with a soft cloth and place it in the sun to dry. Its color will be quite restored, as the rays of the sun have a bleaching effect upon it.—*Godey's Lady Book.*

Damage from Soda in Washing.—Thirty years ago the linen parts of shirts were worn out before the cotton; now it is the reverse, and both perish much sooner than they used to; the cotton does not last a third as long, in the experience of some of our acquaintances. This hasty rotting of cotton fabrics is ascribed to the hasty processes of bleaching, and to the excessive use of soda in washing—but, in the worst cases, chiefly to the latter. A prudent housekeeper should watch to prevent her servants from using soda to save themselves labor. Servants have been known to buy it with their own money for that purpose. As for those who depend on laundresses, there is no remedy but to find, if possible, a laundress who makes clothes last well. The use of a good washing apparatus should abate this nuisance.

Liniment to Relieve Pain.—One of the most powerful liniments for the relief of severe pain is made of equal quantities of spirits of hartshorn, sweet oil and chloroform; dip into this a piece of cotton cloth, doubled, about the size of a silver dollar, lay it on the spot, hold a handkerchief over the spot so as to confine the fumes, and the pain immediately disappears. Do not let it remain over a minute. Shake it well just before using, and keep the bottle very closely stopped.—*Hall's Journal of Health.*

An Excellent and Economical Pudding.—Try this, and you will—as the boys and girls are admonished in the soap—"Try, try again:" "Pare and core half a dozen Rhode Island greenings or other easily cooking apples; chop them into small bits; dry some bread in the oven (stale is the best) until it is crisp; then roll it into crumbs; butter a deep dish, and place in a layer of crumbs; then put in the apples with a little sugar and such like spice as you like; cover the apples with another layer of crumbs, add a little beef suet chopped as finely as possible; pour in a half pint of milk; bake until browned, and serve with hard sauce."

Philosophy of a Sneeze.—The nose receives three sets of nerves—the nerves of smell, those of feeling, and those of motion. The former communicate to the brain the odorous properties of substances with which they may come in contact, in a diffused or concentrated state; the second communicate the impressions of touch, the third move the muscles of the nose, but the power of these latter is very limited. When a sneeze occurs, all these faculties are excited to a high degree. A grain of snuff excites the olfactory nerves, which dispatch to the brain the intelligence that "snuff has attacked the nostril!" The brain instantly sends a mandate through the motor nerves to the muscles, saying. "Cast it out!" and the result is unmistakable. So offensive is the enemy besieging the nostril held to be, that the nose is not left to its own defence. It were too feeble to accomplish this. All the allied armies of muscles join in the rescue—nearly one-half of the body arouses against the intruder—from the muscles of the lips to those of the abdomen, all unite in the effort for the expulsion of the grain of snuff.

An Easy and Simple Yeast.—Take a jar or quart pitcher, and mix in it flour and warm water, with a little salt, somewhat thicker than batter, and about half fall. Then set the pitcher in a kettle of warm water, about the same temperature, which must be kept up by adding warm water occasionally. It must stand thus for five or six hours, and be stirred now and then, until it begins to rise. It will at last fill the pitcher, when it will be sufficient to make two or three loaves of bread, by being mixed with more warm water in the usual way. If you use water half of which is boiling, mixed with half quite cold, it will give you the proper degree of warmth. One great recommendation to this bread is that it never turns sour with age, and is very easily made.

For a Chapped Skin.—Put a large teaspoonful of honey into the basin of water intended for washing yourself.

An Important Discovery.—Mr. Varney, Superintendent of the Pioneer Mill, of this city, and a scientific amalgamator, has lately been on a visit to Ione, the capital of our neighboring county of Nye, and during his stay made a most astonishing discovery. The new mill of that city had been able to extract but about $25 per ton from what had the reputation of being rich ores, and Mr. V. went down to see what was the matter. Upon an analysis of the ore, he found it to consist of sulphur, antimony, arsenic, silver, and what he believed to be quicksilver. Of course, such an ore could not be worked without roasting. A rude furnace was found, where a few hundred pounds could be roasted at a time, and thorough experiments on several ledges were made. The result was that the rock was made to pay, without selection, $140 per ton; but the most singular of all was the great abundance of quicksilver that the roasting developed.

Having ascertained that quicksilver was present, seeing it gather on the iron poker used in stirring the roasting mass, and smelling it in the fumes, the attempt was made to ascertain the quantity. Three and a half pounds of the quartz—not cinnabar—was placed in a retort and heated, and nine ounces of pure quicksilver obtained, being over eighteen per cent Upon a thorough examination of the lode, large quantities of rich cinnabar, the ore of quicksilver, were found. The rock experimented on contained this useful metal in a native condition. The extent of these cinnabar-bearing lodes was found to be great, indicating that we shall be able to furnish our own supply of quicksilver, and probably have it to export. Reese River is evidently the country for the miner. A bountiful Providence has seamed its hills with the most valuable of minerals and deposited in the plains the salts and alkalies necessary for their reduction, and other economic uses of man. Silver, gold, iron, copper, lead, arsenic, nitre, sulphur, salt, oil, plumbago, fire clay, and so on without end, and now is added quicksilver, which, for our metallurgical purposes, is one of the most important of all.—*Reese River Rev.*

God is Nature.—When Napoleon was returning from his campaign in Egypt and Syria, he was seated one night upon the deck of the vessel under the open canopy of the heavens, surrounded by his captains and generals. The conversation had taken a skeptical direction, and most of the party had combatted the doctrine of Divine existence. Napoleon sat silent and musing, apparently taking no interest in the discussion, when suddenly raising his hand, and pointing to the crystaline firmament, crowded with its mildly shining planets, and its keen, glittering stars, he broke out in those tones that so often electrified millions: "Gentlemen, who made all that?" The "eternal power and godhead" of the Creator had impressed by "the things that are made;" and these words of Napoleon to his atheistic captains silenced them. And the same impression is made the world over. Go to-day into the heart of Africa or into the center of New Holland; select the most imbruted pagan that can be found; take him out under a clear, star-lit heaven, and ask him who made all that, and the idea of a Superior Being, superior to all his fetish and idols, possessing eternal power and Godhead, immediately emerges in his consciousness. The instant the missionary takes this lustful idolater away from the circle of his idols, and brings him face to face with the heavens and the earth, as Napoleon brought his captains, constitutional idea draws again, and the pagan trembles before the unseen power.—*Prof. Shed.*

Live Within Your Means.—We don't like stinginess, we don't like economy, when it comes down to rags and starvation. We have no sympathy with the notion that the poor man should hitch himself to a post and stand still, while the rest of the world moves forward. It is no man's duty to deny himself every amusement, every recreation, every comfort, that he may get rich. It is no man's duty to make an iceberg of himself, to shut his eyes and ears to the sufferings of his fellows, and to deny himself the enjoyment that results from generous actions, merely that he may hoard wealth for his heirs to quarrel about. But there is an economy which is every man's duty, and which is especially commendable in the man who struggles with poverty—an economy which is consistent with happiness, and which must be practiced if the poor man would secure independence. It is almost every man's privilege, and it becomes his duty to live within his means; not to, but within them. Wealth does not make the man, we admit, and should never be taken into the account in our judgment of men; but competence should always be secured, when it can be, by the practice of economy and self-denial only to a tolerable extent. It should be secured, not so much for others to look upon, or to raise us in the estimation of others, as to secure the consciousness of independence, and the constant satisfaction which is derived from its acquirement and possession.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, March 25, 1865.

Applications for accommodation in Bank have been rather more numerous this week, and owing to some local influences of a temporary nature the money market has shown greater stringency than at any time since the opening of the year. Loans have been made by bankers upon unexceptionable names and choice securities at full rates—1½ ₱ cent. per month—and in the open market, 2@3 ₱ cent. per month has been paid on less desirable collateral.

Receipts of treasure since the 1st inst., from the interior and northern coast have been large, and amounted in the aggregate to $3,950,000. The shipment of bullion by Thursday's steamer to Panama, was much lighter than usual, and for this reason, together with the heavy receipts from the mining districts, gold bars have been dull and heavy at 800. Silver is also less desirable from the same cause, and sales are being made at ½@¾ ₱ cent. premium for average Washoe bars.

The Stock Market since Saturday last, has been apathetic and less firm, so far as a few leading shares were concerned, but other stocks were active and for the most part well sustained. The suspension of telegraphic communication with the East until yesterday, has had some influence upon the Stock Exchange. New York parties have now become largely interested in a number of mines, and owing to recent favorable developments in some of them and the regularity of dividends from others, coupled with the decline in gold, these capitalists seem disposed to increase their interests in this quarter. At the close, the general market exhibits more strength.

City Stocks continue dull and little or no change has taken place in current quotations. San Francisco 7's are in more favor at 73 bid, and 6's of '58 are inquired for at 61. Sacramento County Bonds are held at 45, and Sacramento City 6's are without a market. State Telegraph has been sold at 35. San Francisco Gas has advanced to 80 bid, and Spring Valley Water has improved a fraction.

Legal Tender Notes have been attracting the attention of speculative operators for some time past, and the recorded sales during the week amounted to $405,000, advancing from 56 to 62⅛, and closing last evening at about 61c. Telegraphic advices from the East quote gold as low as 154 on the 21st inst., but much higher figures are reported since then.

Yellow Jacket receded from $2,750 to $2,500, advanced to $2,600, and was sold yesterday afternoon at $2,750. Within this range 38 feet were dealt in. We are informed of no material change in the mine this week. The south drift continues to disclose a large mass of fine ore, and the operations of this company are progressing with great vigor. It is believed that the yield of bullion for the current month will amount to some $300,000, guaranteeing a dividend of $100 per foot, and a surplus in the treasury.

Gould & Curry has been steady but inactive; 21 feet were sold, declining from $1,900 to $1,875, rallying to $1,950, and closing at $1,950 bid, and $1,970 asked. Thus far this claim has been the favorite of Eastern capitalists, who now hold a large proportion of the stock and are still buying. Receipts of bullion are up to the usual average of the past few months, and the regular dividend of $75 per foot will be declared for this month.

Savage fell from $1,735 to $1,700, rose to $1,745, receded to $1,720, rallied to $1,765, and closed at about $1,770 asked, 26 feet in all changing hands. The *North Potosi* chimney in this mine is said to look as well as ever, and other portions of the claim are no less promising. The usual dividend will be disbursed to the stockholders for the month of March.

Belcher declined from $1,640 to $1,575, rallied to $1,600, and closes at $1,600 bid; 25 feet were sold. At the lowest working level, the lode in this mine is some 500 feet in length, and the richest pay streak from 8 to 10 feet in width. A large reserve of fair ore is allowed to remain untouched, and only the better quality is now taken out. The dividend for this month will be increased to $75 per foot, leaving a balance at the credit of the company.

Crown Point is in good request, and 17 feet were sold, declining from $1,500 to $1,440, advancing to $1,500 again, and held yesterday at $1,510. The Marysville and Phœnix Mills are crushing some fifty tons of ore daily, but other mills are to be employed as soon as the air chambers are made to communicate with the upper works and larger quantities of ore can be hoisted with more facility.

Potosi has continued to be actively dealt in, and 120 feet changed hands, opening at $970 per foot, advancing to $990, declining to $900 rallying to $975, receding to $900 again, then advancing to $975 buyer 30, dropping to $950, and selling yesterday at $950. The product of this mine is at present about 180 tons of ore per day, and the aggregate yield of ore for the month will amount to some 5,000 tons.

Chollar is in rather more favor, and 633 feet have been sold, declining from $660 to $600, advancing to $727½ buyer 30, receding to $660, rallying to $700, and closing at abont $695. The east wall of the ledge in the fifth level of the south mine has been reached by the drift from the main shaft, and at that point, it is believed, a substantial deposit of pay ore has been found. A prospecting shaft, sunk from the fourth level, also discloses good ore. The pay portion of the lode in the latter level was some 200 feet in length. The suit of this company *vs.* Potosi, to determine whether former decisions were a bar to further litigation, has been set for trial to-day.

Ophir has been dull and in less request; some 42 feet were sold, declining from $450 to $425, rallying to $430, and closing at $430 bid.

Uncle Sam is still in favor, and 275 shares were dealt in, declining from $375 to $325, rallying to $340, dropping to $320, and selling yesterday at $325. It is said that in the third level good ore has been found, and in the fourth the pay vein is 16 feet in width. The fifth level has not yet been reached.

Hale & Norcross rose to $350—assessment of $50 delinquent—and declined to $325, small transactions taking place.

Empire Mill & Mining is in better favor, and is held at about $500 per share. The injury done to this mine by the recent cave proves much less serious than was apprehended. The damage sustained has already been repaired, and work in the mine is going on as vigorously as ever. The company have just run a drift into their south mine, adjoining "Bowers' claim," and struck a body of very rich ore.

Imperial has been more actively dealt in than for some time past, and 508 shares were sold, advancing from $175 to $205 per share, buyer 30, dropping on Thursday to $180, and rallying yesterday to $202½, buyer 30. The company are crushing some 80 tons of ore per day, in their two mills, and the receipts of bullion will, it is thought, reach $80,000 for the current month. After the payment of a dividend of $10 per share, a surplus of some $20,000 will probably be left in the treasury.

Burning Moscow steadily rose from $28 to $37, and closed at $38. Some 800 shares were sold.

Bullion declined from $110 to $105, and is now held at $102. North American fell from $38 to $35, and rose to $36; some 100 shares changing hands. Nevada (J. G.) was sold at $39 per share.

Wide West declined from $30 to $18, and closes at $16 bid. Daney fell from $25 to $15, and rose to $18. Sheba was sold at $21; Buckeye at $10 to $8½; Lady Bryan at $8 and $10; Caledonia Tunnel at from $10 to $11½, and Sierra Nevada at $23.

The total sales of stock and Legal Tender Notes, since Saturday last, amounted to $1,282,683.

[ADVERTISEMENT.]

To the Public, and to Millmen in Particular.

As Thomas Varney has not, up to this date, withdrawn his notice in the "Mining and Scientific Press," in which appears the following language:—

"All persons are warned against purchasing machines made at the Miners' Foundry, called 'Wheeler's Amalgamators,' as they are an infringement on my patent, and a suit is now pending in the United States Circuit Court, against the parties infringing;"

In justice to myself I am compelled to give to the public a statement of the facts in the case, and show the position which Mr. Varney and myself occupy as Patentees. He commenced suit against me, and the Miners' Foundry, for $90,000, about the 1st of March 1863, and threatened suit against any and all persons who should buy my amalgamators, thus greatly damaging my business. To show the injustice of this suit against a "poor hard working mechanic," I will quote from the opinion of Judge Heffman, as rendered in the case last November. He says:

This is an action for the infringement of a patent issued to the plaintiff on the 16th of December, 1862, for an "Improvement in Amalgamators for gold and silver." The machine alleged to be an infringement has also been patented—the patent being dated December 8th, 1863. The defendants deny the alleged infringements, and the novelty and originality of the plaintiff's invention. They have also given notice, under the statute, of various other defences, hereafter to be noticed.

Models of the two machines were exhibited in Court, and a large number of witnesses called to explain their construction and mode of operation. It is apparent that the patented machine of the defendant closely resembles, if it be not substantially identical with, the improved and modified machine now manufactured by the plaintiff. But the inquiry is not whether Wheeler's machine resembles that lately used by Varney, but whether the former is substantially the same as the machine described in Varney's patent. That Varney has, in many important particulars, modified the machine as described in his patent, is obvious. Indeed, his late machines resemble much more nearly in external appearance, and in their mode of operation, the Wheeler patented machine than they do a machine constructed according to the drawings and specifications of his patent.

After describing Mr. Varney's pan and its operation, the Judge says:

It appears, however, that the idea of working ores in a batch, by causing them to pass repeatedly between mullers, the upper one of which is provided with openings at the center, is by no means novel.

J. E. Clayton testifies that, so long ago as 1845, he arranged a machine in Tallahoosa, Alabama, for the reduction of gold ores, which embodied substantially the same principle.

* * * * * * *

In Overman's Metallurgy, p 267, a similar arrangement is described. * * * It is evident that the author is here describing an existing and well known machine, the usefulness of which has already been ascertained.

It is also apparent that the result aimed at is the same in this machine as in that of the plaintiff, and that the means adopted to accomplish it are substantially similar. In both machines the pulverization of the ore is effected by means of a bed plate upon which a muller rotates, with central openings to permit the pulp to pass continuously and repeatedly between the grinding surfaces until the operation is completed.

Amongst other things the Judge quotes the following from Judge Story:

But in all cases where the patentee claims anything as his own invention in his specification, Courts of law cannot reject the claim, and if included in the patent and found not to be new, the patent is void, however small and unimportant such asserted invention may be.

* * * * * * *

Here the plaintiff claims a particular position of machinery as his invention, and it clearly appears in evidence that the position is not new. It has existed before—not in machines exactly like the present, but in machines applied to analagous purposes, viz: in machines applied for the same purpose as the plaintiff applies them. The objection therefore, is fatal.

In the defendant's machine, the pan in two parts, provided with flanges, packing, &c., to which the plaintiff in his patent attaches so much importance, is not used, but a deep pan is substituted with a wooden cover.

The arrangement of the slots or shoes on the muller is different. The upper muller is provided with spiral ridges arranged to operate with similar ridges reversely inclined on the inner surface of the pan, to raise the pulp and promote the circulation. The upper muller is attached to the shaft by an universal joint, and by a mechanism quite dissimilar to that described by the plaintiff. And for the scrapers are substituted broad guide plates extending and secured to the edge of the pan, and capable of being elevated or depressed by means of a mechanism not found in the plaintiff's machines.

Assuming then—as in the point of view in which we are considering it we must—that each of the several parts of the plaintiff's machine is old, and not separately patentable, it seems clear to me that if the patent for the machine can be sustained, as for a new combination; which I think doubtful, the combination of the defendant is at least as novel as that of the plaintiff.

We have already seen that the muller rotating upon a bed plate, with central openings, and arranged in a pan so as to create a circulation of the pulp, is not a new invention. The tub, composed of two parts, with flanges, packing, &c., is not claimed to have been used by the defendant. In fact it is now discarded by the plaintiff, and a deep pan, with muller attached by an universal joint, has been adopted by him in his later machines. The infringement, if any, must consist in the use by the defendant of the scrapers described in the plaintiff's patent.

The inquiry thus arises—are the curved plates described in Wheeler's patent, substantially the same in their structure and operation as the scrapers of the Varney patent, and if so, do the latter constitute a "material and substantial part of the things patented by Varney, definably distinguishable from the other part." To determine this question, a brief description of Wheeler's machine is necessary.

The Judge then describes the Wheeler pan and the Varney pan and scrapers, and says:

In the Wheeler pan four plates are used while Varney employs only two scrapers. The form or curve given to these plates in both machines is similar, though not identical; but in their structure, arrangement, and the use for which they are intended, there is an essential difference. The scrapers of Varney are represented as of inconsiderable width, and extending from a ring at the center to the periphery of the muller—they rest apparently upon the surface of the muller, and no means of elevating or depressing them are mentioned in the specifications or exhibited in the drawings.

The plates of Wheeler are of considerable width, and attached to a frame suspended from the top of the shaft, resting upon a vertical screw, by means of which the frame and plates attached to it may be elevated or depressed. The plates extend to the inner surface of the pan, where they are secured by slides. The office of these plates, as described in Wheeler's patent, has already been mentioned. It appears to me that the scrapers of Varney neither serve, nor were intended to serve, any such purpose. [Here the Judge gives his reasons for the above opinion.]

For these reasons I am of opinion that the curved plates of Wheeler differ from the scrapers of Varney in their form and arrangement, their object and effect, and that therefore their use is not an infringement of Varney's patent.

Much testimony was taken to show that in fact Wheeler's invention was prior to that of Varney's and that the latter derived his ideas from the former

It is claimed by Varney that his invention was, in its

essential features, matured and perfected in August, 1861. But this statement seems hardly consistent with his declarations or his conduct.

Varney's application for his first patent was not made until the end of October, 1861. That machine has since been discarded as useless.

If then, at the time of this application, he had already matured and perfected the invention of another and far better machine, he committed a practical fraud upon the public in withholding from them the benefit of his skill and ingenuity. It is certainly strange that he should have gone to the trouble and expense of procuring a patent for his first machine, and delayed, for nearly a year, his application for a patent for the improved machine which he had, as he says, already invented.

It may well be doubted whether, if it be true as Varney states, that at the time of his application for his first patent he had already completed and perfected his improved machine, the suppression would not be fatal to both. It appears in evidence that, so early as December, 1861, Wheeler had conceived and communicated to Stewart & Kirkpatrick at Washoe, the idea of his machine. He explained to them the mode in which the circulation, or over and under current was to be produced, and the gulch hoards by which it was to be assisted.

In January, 1862, drawings of this machine were received at the Miner's foundry, and Stewart, the partner of Churchill, was desirous of having his pans constructed on that plan. The theory and construction of the proposed pan were fully explained to Varney, who succeeded, however, by affecting to consider Wheeler's pan a "humbug," in dissuading the parties from adopting it, and in inducing them to order pans made on the model of his own patent. These were subsequently discarded as useless. We are driven to adopt one of two suppositions: either that Varney wilfully deceived Stewart in inducing him to order an inferior pan, or else that he had not at that time discovered the mode of producing the over and under current, recognized its utility and invented a machine to effect it.

Wheeler commenced manufacturing his machines in January, 1862. He commenced using them in June of the same year. They were constructed at the Miners' Foundry by the defendants to this cause, under the immediate observation of Varney. But in his conversation with Scott, in July, 1862, and in his communications with the defendants, he does not appear to have intimated that he was the first inventor of the Wheeler machine, and that in constructing the latter they were violating his rights. Up to the end of 1862, he continued to have his own pans built at the same foundry; and it he really considered the construction of Wheeler's pans to be an infringement of his own invention, his silence is inexplicable. His delay in applying for his second patent is equally unaccountable. In August, 1861, he had, as he says, completed and perfected his invention of his improved machine, and yet in October of that year he applies for a patent for his first and imperfect invention, and delays his application for a patent for his improved and perfected machine until the end of June, 1862—more than a month after Wheeler had taken the preliminary steps to obtain his patent.

It is unnecessary, however, to pursue this inquiry further, for in the view I have taken of the case the question of priority of invention is immaterial.

The Judge then notices the other grounds of defence, and says:

If this view of the effect of that statute be correct, it affords a defence to Wheeler as well as the other defendants. It is not pretended that he has used any machines not manufactured by them, or that he has infringed the plaintiff's rights, otherwise than by receiving from the other defendants the sum agreed to be paid by them on the sale of his machines.

I find, therefore, for the defendants.

[In this candid statement to the public, I should have preferred to have given the decision of the Judge and the findings of the Court in full, but for the great length of space they would occupy; and I will state that the same can be found in the "Mining and Scientific Press," of December 10th and 31st, 1864, and invite their thorough perusal.]

It will be seen by the above statements that Mr. Varney is infringing on my patent right by the use of wide guide plates in his pans, instead of my infringing on his patent. The truth is, he never used any but narrow scrapers in his pans until after I had put my pans in operation, and they had proved a success. None of his pans made prior to the year 1863 ever run six weeks without being condemned and thrown aside. This may account for the fact the he afterwards altered his patterns and made them like mine, with an open, deep pan, and wide guide plat-s instead of scrapers, and put a wooden cover on the pans.

Having established my right in my patent Amalgamator, it is now my turn to protect myself against the infringement of "Mr. Varney, or any other man," and I intend to do it; and all persons are hereby warned not to purchase or use machines called "Varney's Amalgamators," as made at the Union Foundry, Pacific Foundry, or any other place, as they will make themselves liable for an infringement on my patent right.

Having made some important improvements in my Amalgamators, the public are invited to call and examine them at the Miners' Foundry, San Francisco, or at Prescott & Schiedel's Foundry, Marysville, where they are manufactured ZENAS WHEELER.

Rules for Advertising Assessments of Corporations on Saturdays.

Levy your Assessments upon any day EXCEPT FRIDAY.

Advertise the ASSESSMENT NOTICE on the FIRST FOUR SATURDAYS succeeding the day upon which the assessment is levied.

Appoint the day for advertising the DELINQUENT SALE on the FIFTH SATURDAY succeeding the date of levying the assessments.

Appoint the DAY OF SALE on the SEVENTH SATURDAY succeeding the date of levying the assessment, or any day *previous* to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Wm. R. Bradshaw—San Joaquin, Calaveras, Merced, Tuolumne, Stanislaus and Mariposa counties.

Mr. Robert Lattimore—Butte and Yuba counties.

W. H. Laws—Placer and El Dorado counties.

Thos. Poyzer, of Grass Valley, for Nevada county.

THE GOLD, SILVER AND COPPER MINES OF MOUNT DIABLO.

Upon the northerly flank of Mount Diablo may be seen a spur of primitive formation, similar to that of which the main body of the mountain is composed, thrown out some two or three miles in a northerly direction from the principal, cone-shaped upheaval of the main summit. The easterly declivity of this slope is deeply indented by two cañons, known as the Mitchell and Bagley cañons. The former almost completely severs the northerly portion of this spur into an isolated summit, which is known as Mount Zion, and which overlooks the town of Clayton. Near the peak of this summit, and on the westerly slope, we have the Summit of Zion mine, and on the easterly slope is located the Mount Zion Copper Company. Of these companies we shall speak more at length next week. In passing through the Mitchell cañon, upon either hand, but chiefly upon its northerly acclivity, may be noticed numerous other companies working for copper. Although very fine specimens and bunches of sulphurets, together with some native copper, are found, no very extensive operations have yet been carried on there, for the reason that no well-defined veins have yet been discovered; the bunches of ore having the appearance of being isolated deposits. This cañon and Mount Zion, already described, contain the chief copper deposits yet found in and about Mount Diablo.

Following along the spur above indicated, toward the main Mount Diablo summit, and passing the mouth of Mitchell cañon, a short distance, we come to the mouth of another ravine, known as Bagley cañon. This runs nearly parallel with Mitchell cañon, and segregates, but at a higher level, another portion of the spur already mention from the main portion of the mountain. Ascending to the head of this cañon we come to the mining ground of what is known as the Open Sesame Mining Company. This company was incorporated August 5, 1863, and was consolidated from thirteen other companies. The consolidated company now owns what is considered to be nine different ledges, named as follows: Cascade, Black, Henriquita, Carmel, Santa Domingo, Herman, Cortez, San Pedro, La Verdad, La Feliz and White Diamond; they also own the first extensions of the Cascade, Black, Henriquita and Cortez.

The three principal mines of the company are the White Diamond, the La Feliz and the San Pedro. These mines are located on the right hand side of Bagley cañon, just before reaching its source. They are located one above the other in the order named, and are each plainly exposed to view by the wearing away by the waters of this cañon. As these were the only mines belonging to the Open Sesame Company which we had time to examine during our visit at Mount Diablo the past week, we shall, of course, be compelled to confine our remarks to them exclusively. With the exception of these three and the Carmel and Santa Domingo ledges, all the other mines of the company are located in Mitchell cañon. The three which we shall particularly describe, together with the Carmel and San Domingo, are worked for gold and silver; the others, in Mitchell cañon, for copper. The chief work done by the company has been expended in opening the-e three mines, and in constructing a road to them through the cañon. We come first to the

WHITE DIAMOND LEDGE.

This is the lowest in the series of supposed gold and silver ledges, which in geological position overlie the copper deposits of Mitchell cañon, and, if we are not mistaken in our hasty examination, of Mount Zion, also. The stratification of the summit at this point is unmistakable, and is in perfect conformity to that of Mount Zion, a little further north. The trend or direction is nearly north and south, and the dip is to the westward, at an angle of about forty-five degrees. But little or nothing has yet been done towards developing this vein, which has merely been opened. It is massive, some eight feet thick on the surface, and the croppings stretch away to the right (and northward) as far as the eye can reach, and are as distinctly traced as a stone-wall along a brown side-hill. We were informed that it could be thus traced for more than a mile. The vein-stone of this ledge is of a bluish color and exceedingly hard. According to the superintendent's last report to the company, 113 pounds of this rock was sampled and assayed by Riehn, Hemme & Co., of this city, showing a yield of $119 to the ton, in gold and silver.

THE LA FELIZ LEDGE.

This ledge, although it does not show as distinctly upon the surface as the White Diamond, is nevertheless quite well defined. It contains 9,800 feet of ground, and is about 150 yards in vertical hight above the Black Diamond, to which it is parallel. The first tunnel commenced upon this ledge has been continued a distance of 140 feet. The walls of the vein were distinctly defined from the mouth of the tunnel some fifteen feet, at which point a fault was encountered, where the vein matter appeared to have been considerably disturbed. From that point onward the vein walls are quite well defined to the extreme end of the tunnel. The ore taken from this mine bears a strong resemblance to much of the Washoe silver ore, with the exception of some slight presence of copper, as carbonates, yellow sulphurets and the vanadate or peacock ores. The ore is highly quartzose in character carrying spar. Numerous assays of rock from this mine have been made, which have generally assayed about $45 to the ton; some have gone as high as $100, and in one instance an assay, fairly assorted from some sixty pounds of ore taken from a "pocket," went as high as $291 to a ton, (incorrectly printed at the time in the superintendent's report at $201 to the ton.) One lot of two tons, taken as it came from the mine, was brought to this city and worked, a little over a year ago, which yielded at the rate of $26 to the ton. The brick taken from this rock may still be seen at Martinez. The "tailings" from this working assayed at the rate of $10 per ton. The above reports of assays are taken from the superintendent's report.

Below this first tunnel another, intended as the main working tunnel, has been commenced, which will strike the vein eighty feet deeper. A blacksmith forge has been constructed upon the *esplanade*, or level floor, which has been constructed in front of this tunnel, and upon which the ore is to be placed as it is brought to the surface.

THE SAN PEDRO LEDGE.

Going still further up the mountain we come to the San Pedro Ledge, upon which the Open Sesame Company hold 9,800 feet. This vein is equally well defined with those already noticed, and exhibits the heaviest outcrop of any yet opened, measuring about thirty feet in width at the surface. The company commenced work by clearing off an esplanade in front of the tunnel. After which a tunnel was run in about fifty feet, keeping the wall rock well defined upon the left. From this point a drift was run to the right across the vein and thence downwards, nearly in a right line, twenty-two feet, at which point the vein matter was very much concentrated, exhibiting an almost uniform mass of sulphurets, which entirely covered the bottom of the shaft seven by eight feet. Some thirty tons of first-class ore was taken out in sinking this shaft, besides a large quantity of second and third class, that was thrown into the dump. This shaft was full of water at the time of our visit and of course we could not examine it; but we have gathered the particulars from conversation with one of the proprietors and the superintendent, Felix A. Mathews, also a large stockholder. We have examined a large quantity of ore from this shaft. It appears to be remarkably uniform in character, and consists of nearly forty per cent. of light gray sulphurets, of a somewhat friable nature, with a quartzose matrix carrying considerable spar. It is said that some very fine specimens of sulphide of silver were found near the surface. There is no free gold visible to the eye; but from numerous assays made the rock appears to yield from $40 to $45 per ton. A working process yielded, at the North Beach works, in this city, $37 per ton. The ore, for a sulphuret, appears to be one which should be easily worked—there being but little or no indications of antimony or any other particularly stubborn metal present. Of course, the ore will require roasting, but so long as it carries so large a quantity of sulphurets as it now appears to do there will be no necessity for any concentration. The quantity of quartz mixed with the sulphurets will present no material hindrance to a roasting of the entire mass.

CONCLUSION.

From the description given of these veins—their position, their well-defined character and the favorable appearance of much of the ore, judging from observation and reported analyses, we see no reason for entertaining very serious doubts of an ultimately fair paying vein in either the San Pedro or La Feliz ledges. The White Diamond has not yet been sufficiently opened to form any very definite conclusions as to its value. We have said that no fine gold is to be seen in either of the mines, but we are told that small prospects may be obtained from the ravine below. The probability, however, is that when worked in depth, copper will be found to gradually come in, and perhaps entirely change the character of the vein rock. The presence of spar in the matrix of the two upper veins is a favorable indication in this direction. The highly metaliferous character of the San Pedro, in particular, would indicate a very valuable deposit of copper ore in depth, and that that mineral will predominate over silver and gold.

These mines are admirably located for extensive working. They each present a linear front on the steep ascent of a high mountain, dipping away into the depths of the hill almost at right angles with the approach. But little dead work will be required to be done in thoroughly opening up the veins. Most of this has already been accomplished. A fine roadway, of moderate grade, has been partially constructed along the banks of the cañon, to connect the same with the open valley below. A large amount of money, has been spent upon this road. Many of the stockholders have been of the opinion that the money so expended should have been devoted to a development of the mines, and the roads left until after the company had become fully satisfied that they would have a permanent use for them. Probably those through whose instrumentality this work has been done are fully satisfied on this point. We trust that future developments may prove the correctness of their judgment. It is better, however, in all cases, that general improvements about a mine, not absolutely needed at the outset, should be deferred until the necessity for the accomplishment has actually appeared. The action of the Summit of Zion Company, near by the Open Sesame, is one worthy of much commendation in this particular, and presents a lesson of practical economy which has a wonderful effect in producing a willingness on the part of shareholders to come forward promptly with their assessments.

The work upon these mines, as a general thing, appears to have been most judiciously expended, and reflects much credit upon the managers and the Superintendent, Felix A. Mathews, Esq., of Martinez.

Since writing the above, O. C. Coffin, President of the Open Sesame Company, has handed us the following report of working and assays, which have been made the past week in this city, and which he has desired us to publish for the benefit and information of the shareholders in the company:

Working result by Kimball & Murphy, of the European Metallurgical Works, on Bryant street:

A lot of 1,700 pounds of rock from the La Feliz vein yielded at the rate of $2.87 in gold and $2.25 in silver; total, $5.12 per ton.

A lot of 1,900 pounds from the San Pedro vein yielded at the rate of $4.60 in gold and $2.55 in silver; total, $7.15 per ton. In each of the above cases the entire lot mentioned was worked.

Messrs. Kimball & Murphy append to their certificate *an opinion* that the rock from the San Pedro yields a percentage of copper sufficiently large to warrant further development of the vein for that mineral, and we understand that the company intend to send down another lot of rock from this mine to be crushed and assayed especially for copper.

One hundred pounds of ore from the San Pedro was worked raw, without producing any result.

In addition to the above working test, Capt. Coffin also requests us to publish the following assays:

By G. E. Moore—the San Pedro rock was returned as yielding, per ton, $2.41 in gold, with a trace only of silver.

The same assayer returns for the La Feliz—"Mere traces of gold and silver, of no practical value."

Riehn, Hemme & Co. returned as an assay of ore from the San Pedro—$3.15 in silver, with a mere trace of gold.

By comparing the "opinion" of Messrs. Kimball & Murphy, appended to their assay, it will be seen that the views we have expressed of the character of the San Pedro mine, written and submitted to Capt. Coffin before receiving the returns of Messrs. Kimball & Murphy, are remarkably confirmed. We are now more fully assured that the mineral obtained near the outcrop of the San Pedro is simply "mundic," overlying a vein of copper. The expense of proving this will not be heavy, as the vein may readily be opened at a great depth in the lower tunnel. We would recommend that this depth should be reached before any further testing.

With regard to the difference noticed between the assays given in the former portion of this article and taken from the superintendent's published reports of 1863, and those obtained, in part from the same parties, during the past week, and furnished us by Capt. Coffin, we have merely to say, in lack of positive knowledge, that the former *might* have been taken from near the croppings of the mines, which are often found much richer than the ore a short distance below. At all events, this discrepancy goes to show the necessity of moving with the utmost care and circumspection, especially in the beginning of all mining operations.

OPEN SESAME MINING COMPANY.—At a meeting of the Board of Trustees of the Open Sesame mining company, held on Thursday last, T. L. Bibbins was unanimously chosen Secretary of said company—Office, No. 302, Montgomery street.

More Hints on Working Onpriferous Silver Ores.

EDITORS MINING AND SCIENTIFIC PRESS :—In "C. A's." article in your last issue, "On Amalgamation of Copper—A New Re-action," it is said : "Again, place in a test tube some chloride of silver, a little water, and a piece of iron and apply heat. In a short time a portion of the silver will contain proto-chloride of iron in solution." Now is the proto-chloride of iron formed by this reaction? The elements contained in the test tube are oxygen and hydrogen (water), chlorine and silver, and metallic iron. Is not the water decomposed? the oxygen going to form a solution of protoxyd of iron, proved by yellow prusiate of potash; the hydrogen to the chlorine forming hydro-chloric acid and leaving the silver metallic? The hydro-chloric acid, so formed, would dissolve oxyd of copper that might be present, and if any metallic iron was in the solution it would precipitate metallic copper.

He continues: "decant this solution into another tube, add thereto a little oxyd of copper and apply heat; in a few seconds copper will be formed in solution, and if the heat be continued, a bulky red precipitate will be seen which proves to be sesquioxyd of iron."

What has been the chemical re-action that has produced the above sesquioxyd of iron? Was it not a proto-oxyd and converted into sesquioxyd by the oxygen from the oxyd of copper? If the above deductions are correct "C. A." must be in error, for it appears all to hang on the combination formed with the iron.

In the chloridizing roasting of silver ores the most, if not all of the associated copper ore, is supposed to be converted into a soluble compound that may be extracted by leaching with water until the last trace of copper passes out, after which it can be reduced by the method spoken of, and pure silver obtained.

ORLANDO JENNINGS.

Grass Valley, March 20th, 1865.

MESSRS. EDITORS :—I see in an article in your last issue, headed "A New Reaction," that friend "C. A." is under the impression to have made the discovery that oxyd of copper could be transformed into a chloride by chlorides of iron. He will, perhaps, allow me to inform him that poor copper ores have been worked on this principle for a long time at Linz, in Germany. I will direct his attention to *Kerl's Metallurgy*, Vol. II, page 593, for proof. Kerl says: "The pulverized copper ore (tailings) in an *oxydized state* is dampened with a solution of *chlorides of iron*, using three parts of proto-chloride of iron (Fe Cl) for every part of copper in the ore. The tailings are exposed to the action of air for two or three weeks, whereby a partial chloration of the copper takes place. *The greatest part of the oxyd of copper forms a proto-chloride* (Cu. Cl.); another soluble part, however, cannot be extracted, even after using a considerable excess of sesqui-chloride of iron ($Fe^2 Cl^3$), but is soluble in weak hydro-chloric acid.

The reaction as given by "C. A." is, however, very little known, and will be appreciated by many experts who never investigated the subject closely. Yours truly, DEETKEN.

SKINNING CATTLE BY MACHINERY.—There is a butchering establishment in Paris where the hides are taken off from the animals by means of air compressed by a force-pump in a cast-iron cylinder until it has a pressure of three or four atmospheres. One or more flexible tubes fitted with cocks, pass from the cylinder to the slaughter-house. The extremity of one of these tubes is inserted in a small opening made in the haunch of the slaughtered animal, and the compressed air is turned on by means of the cock. The hide is then separated with the greatest ease and with little or no exertion on the part of the workman; and it is not in the least distorted or stained. A sheep may by this method be skinned in one minute, a calf in two, and an ox in five.

ORES FROM THE COLORADO.—Sixteen hundred bags of ore are reported *en route* from the Colorado for this city, by one shipment—1,100 of which are from the Planet mine. The Colorado trade is already assuming quite an importance, which will grow and increase with the development of the mines of that region.

PATENTS RECENTLY ISSUED TO CALIFORNIA INVENTORS.

ARM SUPPORTERS FOR RIFLEMEN.—Seth Kinman, Humboldt—First: I claim an arm supporter and rest, constructed and operating substantially as set forth. Second: The combination of the base or band A, and bars E and F, constructed as described. Third: I claim the bar F, provided with an arm place, E, and jointed to a support, F, in such a manner that said bar may be fixed as a rigid support for the arm, or made to vibrate freely, as required, substantially as set forth.

BUTTER MOULD.—Oliver Allen, San Francisco, Cal.—I claim a butter mould, constructed and operating substantially in the manner shown and described. This invention consists in forming a mold by which butter may be divided into parcels of such a shape and quantity as are required in preparing it for market, the mold being varied in size and shape to suit the demand of the fancy which prevails in different communities or markets.

FLEXIBLE PIPE FOR MINING. — Anthony Clark, (assignee to himself and Gorham Blake,) Tedds Valley, Cal.—I claim the improved flexible conduit made as described, viz: of metallic pipes, cloth connection, clamping rings, valves and valve openings, constructed and arranged together, substantially as represented and explained.

THE LARK.—Take it for all, no bird in either hemisphere equals the English lark in heart or voice; for both unite to make it the sweetest, happiest, the welcomest singer that was winged like the high angels of God's love. It is the living ecstacy of joy when it mounts upon its "glorious privney of light." On earth it is timid, silent and bashful, as if not at home, and not sure of its right to be there at all. It is rather homely withal, having nothing in feather, feature or form to attract notice. It is seemingly made to be heard, not seen—reversing the old axiom addressed to children when getting voicy. Its mission is music, and it floods a thousand acres of the blue sky with it several times a day. Out of that palpitating speck of lively joy there wells forth a sea of twittering ecstacy upon the morning and evening air. It does not ascend by gyrations, like the eagle or birds of prey. It mounts up like a human aspiration. It seems to spread out its wings and to be lifted straight upward out of sight by the afflatus of its own happy heart.

To pour out this in undulating rivulets of rhapsody is apparently the only motive of its ascension. This it is that has made it so loved of all generations. It is the singing angel of man's nearest heaven, whose vital breath is music. Its sweet warbling is only the metrical palpitation of its life of joy. It goes up over the roof-tree of the rural hamlet, on the wings of its song, as if to train the human soul to trial flights heavenward. Never did the Creator put a voice of such volume into so small a living thing. It is a marvel, almost a miracle. In a still hour, you can hear it almost a mile's distance. When its form is lost in the hazy lace-work of the sun's rays above, it pours down upon you all the thrilling semi-tones of its song as distinctly as if it were warbling to you in your window.—*Elihu Burritt.*

THE OIL REGIONS.—An indefatigable gentleman of this city has been making a tour of the oil regions from Mount Diablo to the lower country, and brings back an interesting and encouraging report, as far as the extent of his observations would authorize. He found unerring indications in a number of places, and in spots where the prospectors went to work, they struck oil very close to the surface. From one orifice they made, it rushes from a spring in a stream so clear and pure that it will burn vividly in a lamp, without any refining. We have seen samples, and can vouch for its correctness. On one claim, that gave little or no promise, the party found a thick solid bed of asphaltum, hard as a rock. They cut down through this, and oil came forth in quantities on the surface of the water. At the now well-known Sargent Ranch, there are asphaltum beds one-half mile in circumference, with twenty or thirty springs of oil breaking out in different directions.—*Flag.*

MINING FOR SILVER.—Eight companies, says the Folsom *Telegraph*, are now sinking shafts in the silver district about Rose Springs, in Placer county, and all consider their prospects flattering. The shaft on the Layne Claim" has reached a depth of forty feet, and the owners show some fine looking rock. The ledge is increasing in width, and all seem sanguine of rich results. We trust they may be gratified.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—Nos. 11 and 56 Government House, corner Washington and Sansome streets, San Francisco.

Information for Inventors!

The Patent Law Amendment Act, of March 3th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property, as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the columns of the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in many cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously employed on analogous devices; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for the period of three months, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $30. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; and our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & CO., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oilcloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 years and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to the arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, Government House, corner Sansome and Washington streets, San Francisco.

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by one half than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only half, living prices, believing that a journal like ours, unincumbered by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it all that is requisite, and we are confident we shall receive it

DEWEY & CO.,

Copper Mines in Mariposa County.

An observing friend and intelligent writer permits us to make the following extract from a description of his recent visit to Mariposa county:

When the snow storm had given way to sunshine, I mounted my horse and made my way to Hunter's Valley, in which, in the month of July last, was discovered the copper mine now known as

"LA VICTOIRE."

I was received by the courteous superintendent in the most hospitable manner, and gladly accepted his kind invitation to become his guest during my stay in the Valley.

The air of comfort and prosperity which was evident throughout the little camp, was a favorable augury of the mine, which is the nucleus around which is gradually gathering a population of miners and traders, and the usual elements of a mining camp.

Early on the following day I made a visit to the mine. As the Victoire is destined to become one of the leading attractions of Mariposa county, I feel bound to give a full description of the local position and mineral characteristics which mark it out as one of the most remarkable copper lodes of the Pacific coast.

The first indications of copper were found on the crest of a mountain, surrounded by ravines of moderate depth, giving an elevation from the base of about 275 feet. The lode traverses this mountain in a direction north 80 degrees west, and has an average width of five feet. In the month of September, 1864, a shaft was sunk on the lead on the eastern declivity of the mountain, following down the lode. The croppings were found to be rich carbonates, of which about 100 tons were extracted. The lode then commenced to assume the normal features of a well defined copper mine, preserving its width of five feet, with a dip of forty-five degrees, at the depth of twenty feet, when it gradually increased to sixty-eight degrees. From the level of twenty-five feet the ores became more and more sulphureted, intermixed with a stratum of black oxyds of from twelve to fifteen inches, lying principally on the outer surface of the lode. These black oxyds assay from sixty to seventy-five per cent. The remaining width of the lode consists of sulphurets of twenty-two per cent. average assay. This shaft has been sunk to a depth of seventy-six feet, giving over 1,000 tons of ore, the net proceeds of which will not fall far short of $20,000.

Under these favorable auspices, the able superintendent, Mr. Victor Poupion, determined to open the vein in such a manner as to develop its richness and facilitate the extraction of the ores on the most economical footing. To do this he contracted for running a tunnel from the foot of the eastern slope to meet the shaft at a distance of 450 feet from the base. This has been accomplished in the most effectual manner. The tunnel has a width of six feet by seven in hight, and a declevity towards the mouth of six inches to 100 feet. I witnessed the putting in of the last blast, which opened a communication with the shaft. From this time forward the ores can be extracted at the cost of one dollar per ton, and M. Poupion feels confident he can deliver fifty tons a day at the mouth of the tunnel.

A second shaft has been commenced on the crest of the mountain, at a horizontal distance of 300 yards from the first shaft. At a depth of twenty-five feet black oxyds are found covering the walls of the vein, showing the gradual influence of external causes in changing the character of the ores, and, what is more satisfactory, giving evidence of the continuous and permanent existing of this precious portion of the vein throughout the whole diameter of the mameton. The amount of mineral above the line of the tunnel, as an average of the result given by the shaft, cannot be less than 500,000 tons.

The vicinity of the vein is well covered with oak and pine timber, and springs of water are found in all the ravines. My stay at the mine was prolonged by a snow storm of two days, and a consequent state of the roads which made traveling impracticable; but time did not hang heavily on my hands. My kind host and his worthy assistant were unswerved in their attentions, and the good cheer of the restaurant, under the care of Mr. Victor Ami—*un vrai ami des voyageurs*—contributed in no small degree to the enjoyment of this visit to "La Victoire."

I took leave of my new friends with sincere thanks for their kindness and hearty congratulations on the splendid prosperity they have before them.

For the Colorado.—Quite an amount of goods are now being shipped from this port for the Colorado and Arizona mining regions, also for Salt Lake City. The ship Isabel takes the first shipment by the new route for the last named place.

To Mining Secretaries.

We positively refuse hereafter to receive advertisements of any mining company for the payment of which the Secretary is unwilling to vouch. We shall also exercise the right to eject from our columns, at any time during the course of publication, any advertisement for which payment is not made, or security given upon proper notification.

DEWEY & CO.,
Publishers Mining and Scientific Press.

Register your Letters.—In remitting cash for subscriptions to the Mining and Scientific Press, our patrons will please register their letters, and we will then be responsible for their reception. Parties remitting without registering their letters will do so at their own risk. The fee for registry is twenty cents, for which a receipt is returned by the Postmaster to the sender from the party receiving the money.

Mr. W. C. Salmon, one of the proprietors of Salmon's amalgamators, arrived in this city, on Wednesday evening, from Reese River. He reports exceedingly favorable with regard to the mining prospects of that region, and also brings down a large amount of specimens from different ledges, selected for the purpose of showing the general characteristics of these mines. He informs us that he has just devised a new settler and concentrator to go with his amalgamator, which will soon be set up and put in operation in this city. Both machines will be illustrated in the Mining and Scientific Press within two or three weeks.

A PAPER OF THE OLDEN TIME.

Mr. E. C. Stock, of the Clipper Restaurant, has left at our editorial rooms a copy of *The New England Weekly Journal*, dated Boston, April 8, 1728, and "printed by S. Kneeland and F. Green, at the printing house in Queen street, where advertisements are taken in." Among the items we notice the following:

"The most violent storm in Naples that ever was known, has destroyed houses, bridges, men, women and children in great numbers. Out of 500 inhabitants in one village only six escaped."

It appears from the following advertisement that a severe earthquake had recently shaken up the metropolis of the Puritans:

"Just Published—The Nature and Necessity of Repentance, with the Means and Motives to it—a Discourse occasioned by the Earthquake. By the Rev. Mr. John Rogers."

We should judge from the following advertisement, which closely follows the above, that at least a portion of the people of Boston, at that time, had some mind for repentance:

"A very likely negro woman, who can do house-work, and is fit either for town or country service, about twenty-two years of age, to be sold. Inquire of the Printer hereof."

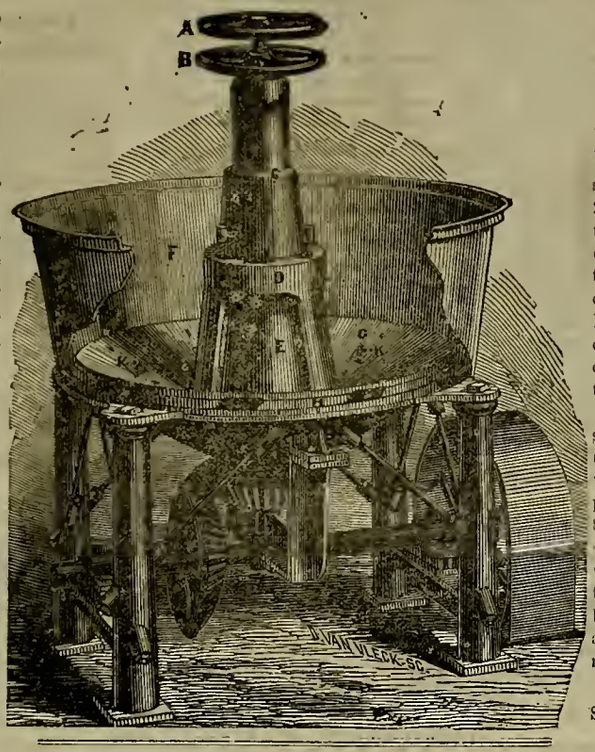
And, again:

"A very likely negro girl, thirteen or fourteen years of age, speaks good English, has been in the country some years, to be sold. Inquire of the Printer hereof."

Another article gives the particulars of a great bread riot in Padstow, England, when some 1,000 tinmen and miners came into town, broke into the warehouses and carried off home all the wheat and salt they could find, because the merchants were intending to ship those articles to foreign ports, and a scarcity of breadstuffs was feared as the consequence. The merchants of those days were doing very much such a business in wheat as some of our merchants are now doing in San Francisco. We trust, however, our miners will act more sensible than did the miners in England in 1728.

The Mines in Congress.—In the United States House of Representatives lately Julian (Union, of Indiana), introduced a bill providing for the subdivision of the gold and silver lands of the United States, and for the coinage of the products thereof. The bill was referred to the Committe on Public Lands. It proposed a radical and entire change in the present policy of the Government respecting our mineral lands, and provides for vesting the fee in individual proprietors by absolute sales, instead of retaining the title in the Government, and treating the occupants as tenants at will. It contemplates their survey and subdivision into small tracts, and fixes a minimum price upon them, graded according to size, locality, and mineral value. It prohibits combinations among bidders at the public sales, and the purchase of any lands by foreigners except those who shall have declared their intention to become citizens.

It provides that actual discovers and workers of mineral lands shall have the right to purchase them at the minimum price, and thus relieve themselves from the disadvantage of competing with rich capitalists. It limits the quantity of mineral land which any single purchaser may buy to forty acres. It requires that the gold and silver produced from these lands shall be coined in the mints of the United States; empowers the President to lay off the mining regions into suitable coining districts, and compels miners to have their gold and silver coined in the districts in which they are extracted. It further provides that every purchaser shall first take the oath of loyalty to the United States prescribed by law, and that the net proceeds of the sales of these lands shall be dedicated and applied to the payment of the principal and interest of the United States.



Silvering.—Cold silvering may be performed on brass and copper which is well cleaned and quite bright, by rubbing with a moistened cloth dipped in the following powder:—1. Chloride of silver, 2 parts, pearlash, 6 parts, salt 3 parts, whiting, 2 parts; mix. When the metal is sivered it should be washed in a hot weak solution of alkali, and then washed dry. Other silvering powders are:—3. Nitrate of silver and salt, of each 1 part, cream of tartar, 7 parts. 4. Nitrate of silver, 1 part, cyanide of potassium, 3 parts. 5. Bath Nitrate of silver, 15 parts, sulphate of soda, 100 parts; dissolve in water, and dip the article into the solution.

HEPBURN & PETERSON'S AMALGAMATOR.

Manufactured at the Principal Foundries in San Francisco.

We invite the mining public to an examination af the working capacity of aur machines, as well as to aur lnte improvements.

For the past year we lnve had aver two hundred of our Pans in operation in the State af Nevada, and mnny in Culifornin and Mexico. And wa find apon careful inquiry that at the majority af the mills where they are ased, thut the pans are charged with about 1,400 pounds of pulverized ore, and thnt they consume from three to four hours in completing the reduction and amalgamation of each charge, the time varying in accordance with the charaeter aad preparation of the ore. Thus each machino works from 4 2-10 to 5 6-10 tons per day, and gives general satisfaction. This is a better record af the working capacity of our Pans thau ean be shown from the practical workings of any other for producing similar results, for the accuracy of which statemeat we refer to aay of the

mills where they nre in use, a list of tho principal ones of which are attached to this circular.

Our late improvements consist in having increased the size of the Pan, without adding to its weight, so that it may now be charged with 2,000 pounds of ore. This seems to be important, as it is the general opinion of those having them that it is preferable to work large charges, giving more time in the Pan for chemical changes, and to completo tho amnlgmnation without at the same time decreasing the amount of work done dnily.

We have also re-arranged oar grinding plates and balaneed our muller in such a way that the weight or bearing of the grinding plates can be regulated as required, the machine now evincing a greater degree of grinding capacity, which will eahance the amouat of work that may be performed in a givea length of time by each machine, as well as economizo the power neeessary to perform it.

HEPBURN & PETERSON.

San Franeisco, Mareh 20, 1865.

Description of the Amalgamator.

Two of the pans heing in operation with one separator, each pan is to he charged with 1,600 or 2,000 pounds of coarse ore, as it is collected from the batteries; at the same time adil suffieient water to keep it to a thick, pulpy consistency. You then take from the quicksilver bowl (attached to the separator) from five to fifty pounds of quicksilver, according to the charueter and richness of the ore, aad add it to the pulp in the pans. The pans are then kept in operation uatil the reduction and amalgamation is eomplete—which time will vary from two to four hours, according to the charaeter of the ore beiag reduced.

It is always best to regulate the working of the pans, so that one charge from tho two pans working in conjunction with a Separator will he ready to be separated at a time, nsing one-half tho time ia the separating thut is consumed in reducing and umalgamating.

After the ore is suffieiently reduced aad amalgamated, the pulp is discharged into the Sepurator and the pau immediately re-charged without stopping the machiue.

The Separator must always contain a suffieieat quaatity of quicksilver to fill the groove in its bottom, and have an additional overthrow af three or more inches each side of the groove. After the pulp is received by the Separator, it is to be thinned with water to a eoasisteney that will allow the quicksilver and amalgam to preeipitate and still retain suffieient body to keep the eoarser partieles of the pulp suspended ia the water with the slum. This condition can readily be aseertained by placing the hand in the pulp when the separation is in progress. If the eondition be proper, the pulp will be sufficiently thin to permit the quieksilver and amalgam to preeipitate, and, at the same time, no perceptible differenee will be felt in the consisteney of the pulp from top to bottom; but if too much wnter be added, you will feel the coarser particles strike against your hand towards the bottom, as they are separating from the slum, and preeipitatiag.

General Instructions for Using.

The aecompanying engraving is a representation of Hepburn & Peterson's Amalgamator. The object of the inventors of this amalgamating pan has been to devise some means to obviate the inconveniences frequently met with in other pans, and arising from a tendeney of the sands to pack when in a certain condition, as it becomes necessary to stop the running of the machine. Another desirable object was the production of a pan which would economize power and admit of the working of the sands in a more compact state, whereby the reduetion is made to progress more rapidly, aad amalgamation brought to a greater degree of perfection. Also to produce a machine that would do a greater amount of work, aad be more simple and therefore more serviceable than those heretofore in use.

These objects Messrs. Hepburn & Peterson claim to hava effected, in an important degree, by the peculiar construetion of the bottom of their pan, which, as will be observed by the annexed illustration, is inclined toward the center, or shaped like an inverted cone—the dies being affixed to this cone-shaped surface, and the mullers made to correspond. The pulp being thrown into the pan, and the mullers set in motion, their action is such as to throw that portion of the pulp which finds its way between the grinding surfaces and the circumference, hence, by gravitatioa, it deseends to the center, aud thence again beneath the mullers. A constaat and active current is thus established, which cannot be done by the same motion when set in operatioa on a level surface. It will thus be seen that all neeessity for wings or scrapers is obviated, which are ofteatimes a hindrance to starting the pan after it has become packed from stopping, especially when it is coarse sands, but slightly advanced towards a pulpy consistency. There are no conditions, in ordinary working, where this pan may aot readily be started without removing or thinning down the pulp, by simply elevating the mullers a trifle by a convenieat set screw, as shown.

Messrs. Hepburn & Peterson have also a Separator, which is employed for separating the amalgam aad quicksilver from the sands after the latter have been thoroughly reduced aud amalgamated in the pan.—*Mining and Scientific Press.*

Illegal Advertising!

We notice many Secretaries are having their notices of delinquent sales published *weekly* in a *daily* paper. As this is a plain violation of the new law we feel it our duty to warn such parties of this error, and herewith append that section of the "Act Concerning Assessments apon the Stock of Corporations," which governs the publication of delinquent notices.

Section 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows: When published in a daily paper, the same shall be published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to the day of sale, the first publication in the weekly being at least fourteen days prior to the day of sale.

By the above extract it will be clearly seen that no delinquent stock can be legally sold by advertising in a daily paper, unless the notice is inserted *daily*.

Now in Its Tenth Volume!

—THE—

Mining and Scientific Press,

—THE MOST—

Profitable Newspaper

—FOR THE—

Readers of the Pacific Coast.

Issued Every Saturday Morning.

DEWEY & CO., Publishers.

Our Journal enters its Tenth Volume with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

We believe that the Press furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the Mining and Scientific Press substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,

An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders.
A Faithful Monitor for Stockdealers,

An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to all Industrial Classes

Upon the Pacific Coast. We shall give accurate and frequent Illustrations of new machinery and inventions.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention af their neighbors to the commendable features of the paper; tha appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

☞ Bound Volumes For Sale. ☜

DEPTH OF COAL BEDS.—Heath's mine in Virginia is represented to contain a coal bed fifty feet in thickness. A coal bed near Wilkesbarre, Pa., is said to be twenty-five feet thick; at Mauch Chunk is a coal bed forty to fifty feet thick; and in the basin of the Schuykill are forty alternative seams of coal, twenty-five of which are more than three feet in thickness. In Nova Scotia is a coal formation 1400 feet deep, and containing seveuty-five alternate layers of coal. The Whitehaven coal mine in England has been worked under the sea; and the New Castle coal mine, in the same country, has been worked to the depth of 1500 feet, and bored to a similar additional depth, without finding the bottom to the coal measure.

AN IRON SHIP.—One of the most interesting visitors now in the barbor of San Francisco is the British iron ship Marmion, from Manzanilla, consigned to Wm. T. Coleman & Co. She brings one thousand tons of sugar for the San Francisco and Pacific Refining Companies, and one thousand bales of hemp for the San Francisco Cordage Factory.

BE CAREFUL OF YOUR HEALTH.—"A man had better break a bone, or even lose a limb, than shake his nervous system. Lord Coke requires only eight hours' application per day for a student of the law, and Sir Matthew Hale thought six as much as he could bear; eight, be said, was too much."

FROGS do not croak in running water, and active minds are seldom troubled with gloomy forebodings. They come up only from the stagnant depths of a spirit unstirred by generous impulses or the blessed necessities of bonest toil.

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties, on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

TO OWNERS OF MINES.

As many mines are being offered in the New York market, and as experience has proved that not one in ten of the titles are in proper form, we will state that the following is considered a good title:—

1. Copy of Notice of Location certified to by Recorder of District.

2. Certificate of Notary that A. B. is Recorder of District.

3. Deed of Power of Attorney from Locators to party selling, which deed or power of attorney must be recorded in the county in which the property is located.

4. Certificate from County Clerk that Notary and County Recorder is duly qualified.

C. A. CRANE,

9v10-1m No. 4 Cedar street, New York.

CHILDREN.—The headaches of early childhood are on the increase; medical men are more than ever alive to the fact that children are over-excited in the nursery, and, but too often, too early, and far too hard-worked in the school room; they are "forced," as gardeners would say, for too early exhibition in the drawing-room. They pass too much of their early life into a sort of orderly, by drill-attained manners, utterly destructive of the sweetest, most healthy characteristics of true children. Forever, from the earliest moment they can be taught anything, they are bidden "not to be rude, but to behave well," as if, in real truth, the prettiest feature of child-life was not a sort of rudeness—the exuberance of real nature. Martyrs to the vanity of our day, they are limb-hampered by the folly which makes them mere dolls for the exhibition of their dresses and the ingenuity of their nurses in dressing their hair. Taught a deportment in character with their costume, they become, but too often, vain little puppet imitations of men and women, all the winning artlessness proper to their age being thus forcibly taken from them; they strut about, pretty pictures, when they had far better be tumbling about with the *abandon* natural to their age, but which would at once destroy the claim to that sort of prettiness their careful "get up" had given them. This precocious training in the nursery has its fruit in that great amount of butterflyism of which we see so much in after life in those stately, artificial, variegated specimens of young lady life, of which every watering-place gives such a cloud. Much real goodness is there in some of them; but there is the same sad sense of "out to be looked at" stamped upon their gait and adorning, only of an older kind, as that with which at from four to seven years of age they entered the drawing room to visitors or the dining room to dessert.

THE Reese River *Reveille*, of March 15th, says; "L. D. Chilson furnishes us the gratifying intelligence that a letter from his brother, now in the East, announces that on the 15th of next month he will leave the city of Chicago, with all the necessary machinery for a quartz mill, including a 100-horse power engine. The capacity of the mill is to be forty stamps, and is destined for Big creek. It is to be conveyed across the Plains, and a train of sixty mules will be required for its transportation."

APPLES.—Apples are perhaps the most wholesome of all fruits. In the regions where the apple thrives, it is the most abundant of all fruits, lasts the year round, and is cheap, easily preserved by drying or canning, and readily cooked. If all persons eat freely of cooked apples as a part of each meal, dyspepsia would be reduced ninety per cent. Raw apples are offensive to most dyspeptics, and many cannot eat apples cooked. For confirmed dyspeptics grapes are regarded as an unexceptional fruit.

A Boiler and Engine, in complete order, of the capacity of **Twenty-five Horse Power.**
19 Inquire at this office.

THE PACIFIC IRON WORKS,
First & Fremont Sts., between Mission & Howard, San Francisco.
The proprietors of the above works, invite the attention of all parties interested, to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting machinery of the most approved construction, Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated
Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

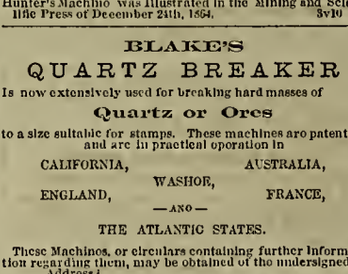
Machinery.

IMPORTANT INVENTION.
Hunter's Concentrator, Amalgamator and Separator.
For the concentration of Gold, Silver and Copper ores, and separating all kinds of metals from the sands, where the specific gravity of the metal is greater than that of the rock, a machine is now on exhibition at No. 524 Market st., above First, at BACON & WEBSTER'S Quartz Grinding Works, where it will be running from two to three o'clock P. M., for the inspection of all interested in mining. The inventor is prepared to manufacture machines to supply all orders promptly. The sixth of a horse power is sufficient to run one of these machines. For the above machine a patent has been applied for. Orders for machines, or for circulars and further information, should be addressed to
ANDREW HUNTER, Inventor.
The following extracts from Reports are submitted to the public as giving the results of a fair working test of these machines:

BEAR VALLEY, DEC. 12, 1864.
MR. A. HUNTER—*Dear Sir:* I take pleasure in stating, in reply to your request, that your concentrator has now been running uninterruptedly, at Princeton Mill, for more than three weeks, and the enclosed notes, by the Superintendent Mr. Williams, of a carefully measured test of its performance during a period of a day and three-quarters, I believe fairly indicates what it has been doing through the whole of that time. First, the loss of the sulphurets, per cubic foot of tailings from the Concentrator, was about one-tenth of an ounce. Second, the loss of sulphurets from the blankets was nearly *fifteen times greater* than that from the Concentrator. The Concentrator has not been found at any time in the slightest manner out of order, and has required scarcely any attention. Congratulating you upon the these facts, I am, sir, very respectfully yours. FRED. LAW OSMEAD, Manager Mariposa Company.

Notes of test run of Hunter's Concentrator—it having been supplied during the test with the sands reduced by one battery of the Princeton Mill, in the condition in which they are usually received by the blankets:—

Running time	1¾ days.
Amalgam saved on the plates of the Separator during above time, value	$6 75
Rate of saving of single machine per day	3 86
Rate of saving of six machines per day	23 16
Yield of Sulphurets, 1¾ days, pounds	215
Yield of Sulphurets, one days run of one Machine	123
Rate per day of saving from six machines, being the whole number required for the Princeton Mill	738
Yield of amalgam from plates of Separator, per ton of rock crushed, value	55
Yield of sulphurets from Separator per ton of rock crushed, pounds	18



HANNIBAL WILLIAMS, Superintendent Princeton Mill.
SAN FRANCISCO, DEC. 16, 1864.
I have recently examined one of Hunter's Concentrators and Amalgamators, in operation at the Princeton Mill, Mariposa Estate, the sand and crushed rock, flowing from one battery of four stamps, passing directly over the machine, without using blankets. On examination, it shows conclusively that the loss of sulphurets by the machine is much less than by the blankets, being but a mere fraction of the sulphurets, consisting of the light and thin scales, such as can scarcely be saved by panning; while on the other hand the tailings from the blankets contain a large amount of heavy sulphurets. The product of the machine is almost pure, clean sulphurets—the copper plates of the machine, being amalgamated, securing much or all of the free gold that escapes the battery. I witnessed the cleaning up of the machine, and the collection of a ball of amalgam. From the weights taken we may state the constitution of this ore, as it came from the batteries at that time, as follows:

Clean Sulphurets containing free gold and amalgam	18.00
Quartz sand, waste	1981.78
Loss of Sulphurets and tailings	.22
Total	2000.00

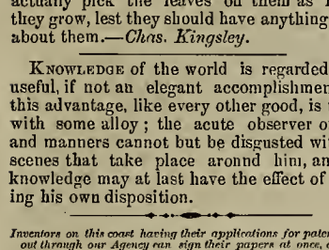
WM. BRUCKNER'S
Furnace for Roasting Ores,

Now in Operation at 416 Market street.
This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron Cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most
Economical and Practical Invention.
The furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse power for the smaller size. Parties wishing to erect such furnaces will please communicate to
W. BRUCKNER,
5v10 No. 416 Market Street, San Francisco.

CHILD TRAINING.—They were as pretty little children once as you could wish to see, and might have been so still, if they had only been left to grow up like human beings; but their foolish fathers and mothers, instead of letting them pick flowers, make dirt-pies, and get birds-nests, and dance round the gooseberry bush, as little children should, kept them always at lessons, working, learning week-day lessons all week-days, and Sunday lessons all Sundays, and weekly examinations every Saturday, and monthly examinations every month, and yearly examinations every year, everything seven times over, as if once was not enough, and enough as good as a feast—till their brains grew big and their bodies grew small, and they were all changed into turnips, with little but water inside; and still their foolish parents actually pick the leaves off them as fast as they grow, lest they should have anything green about them.—*Chas. Kingsley.*



KNOWLEDGE of the world is regarded as an useful, if not an elegant accomplishment, but this advantage, like every other good, is mixed with some alloy; the acute observer of men and manners cannot but be disgusted with the scenes that take place around him, and his knowledge may at last have the effect of souring his own disposition.

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

MINING AND SCIENTIFIC PRESS.—This well conducted journal has entered upon its ninth volume. It is a sterling periodical, and deserves encouragement.—*Territorial Enterprise*

Machinery.

EUREKA

IMPROVED SELF-ADJUSTING

CLOTHES WRINGER,

AWARDED THE FIRST PREMIUM

At Oregon State Fair in 1864.

Abstract from Examining Committee's Report of the San Francisco Mechanics' Institute Industrial Exhibition of 1864:—

"CLOTHES WRINGERS.—A variety of these excellent Household Helps were found competing for popular favor.—Though none of them are entitled to a Premium, we consider the EUREKA, exhibited by M. E. Traver & Bro., worthy of honorable mention." [*Note*—No Premiums were awarded to articles of Eastern manufacture.]

The EUREKA CLOTHES WRINGERS are made superior to all others by the use of

PATENT ELLIPTICAL STEEL SPRINGS,

Which produce a UNIFORM PRESSURE upon garments of every size.

The IMPROVED EUREKA has the HINGE CLAMP, which will fit any tub or box perfectly. Its entire construction is simple and excellent. Every family should have one. It will soon RE-PAY ITS EXPENSE in saving time, labor, and clothes.

M. E. TRAVER & BRO.,

FARRAND'S
Oscillating Amalgamator,

RECEIVER THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN,	W. T. GARRATT,	H. P. WAKELEE,
O. GORI,	GEO. JOHNSON,	C. M. RAECLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.
19v9

HUNT'S NEW DITCHER.

HAVING SECURED FROM THE INVENTOR THE SOLE right to manufacture these Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to

E. O. HUNT,
Windmill Builder, No. 28 Second Street and 110 & 112 Jessie Street, San Francisco. 9v22tf

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating: also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.
1 Golden State Iron Works, San Francisco.

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine	No.	Fine
Assay..... 250	913	Assay 300	990
Assay..... 285	941	Assay for Czotman	980
Assay..... 286	940	Assay Water Rock	966
Assay..... 291	950	Assay Water Rock	993
Assay.....		St. Helena Ledge, W. D.	966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,
To whom all orders should be addressed. 15

Disney's Cylinder Amalgamator.

The Cheapest and Best.

DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.
San Francisco, June 23, 1864. 1-3m

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apertures and between the grinding surfaces. There it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**
1v10 San Francisco.

THE NOVELTY.

This ROTARY CYLINDER GRINDER & AMALGAMATOR *did not receive* the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up, and, in fact, is a perfect machine.

In offering his Amalgamator to the mining public the Inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker on mining machinery, that there was room for improvement in that direction, and that he has, by careful study, invented his improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.

This invention consists of a cylindrical-shaped casing, placed horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller (one or more) placed within it, and covered with shoes and dies half inches thick, and so constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the German Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pulp in one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.

H. L. HOPKINS,
1v10 Inventor and Patentee.

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 50 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street.
15-1m

PRATER'S
PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important Improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time: It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 1864.] HEPBURN & PETERSON.
nov8 3m*

NOTICE TO MINERS.
NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, calculate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer.
24v9

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order, they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

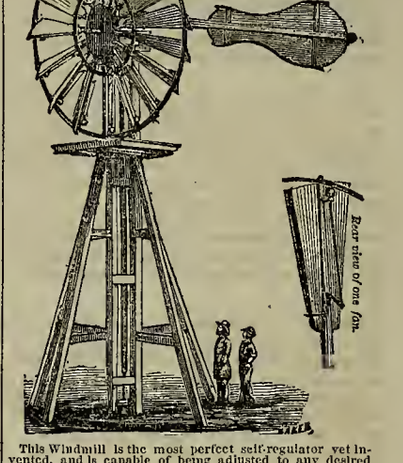
HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power



Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,
No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S
Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

Pacific
BEATER PRESS
Company.

SAN FRANCISCO, CALIFORNIA.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other

HAY AND COTTON PRESSES.

This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay, in dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.

The fact that Beater Pressed hay commands a BETTER PRICE in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.

This press is equally efficient for Cotton, Wool, Flax, Tow, Hemp, Hair, Manilla, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties interested are invited to call and see one in operation.

Office and Warehouse—MISSION STREET, between Main and Beale streets.

W. H. MITCHELL,
2v10 General Agent.

New Mining Advertisements.

Comstock Gold, Silver and Copper Mining Company, San Antonio District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 24th day of March, 1865, an assessment of two dollars and fifty cents ($2 50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at room, No. 9 Mercantile Library Building, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 29th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 13th day of May, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

CHAS. H. PLATT, Secretary.

Office, Room No. 9, Mercantile Library Building, N. E. corner Bush and Montgomery streets, San Francisco.

N. B.—The above assessment is levied for the months of March and April—one-half the amount ($1 25) payable immediately and the balance on or before the 29th day of April next. (mar25) CHAS. H. PLATT, Secretary.

Cuba Gold and Silver Mining Company. Location of Works and Mine, Humboldt District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of March, 1865, an assessment of one dollar per share, in U. S. gold coin, was duly levied upon the capital stock of said company, payable immediately to the Secretary, at the office of the Company, No. 606 Montgomery street, San Francisco, California.

Any stock upon which said Assessment shall remain unpaid on the seventeenth day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the sixth day of May, 1865, to pay the delinquent assessment, together with costs of Advertising and expenses of the Sale. By order of the Board of Trustees.

EDWARD FLANAGAN, Secretary.

Office, No. 606 Montgomery street, San Francisco.

L. J. WILSON, Superintendent, at the mine, Humboldt City, is authorized to receive and receipt for assessments.

mar25-4t E. FLANAGAN, Secretary.

Flora Gold and Silver Mining Company. Cox & Rose Gold and Silver Mining Company, Reese River District, Lander county, Nevada.

IN THE DISTRICT COURT OF THE FIFTEENTH JUDICial District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 15th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk,
By G. C. LETCHER, Deputy Clerk.

C. Sims, Attorney for Plaintiff. 7v10-3m

1852. 1865.
Thirteenth Year of Publication.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributers are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

The Golden Era is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day are published as Serials, from week to week, in The Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the Golden Era are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished talent in the Atlantic States and Europe; including "Orpheus C. Kerr," Fitz Hugh Ludlow, G. B. Densmore, "Mark Twain," Dan De Quille, Florence Fane, Miss Emma Hardinge, Sarah E. Carmichael, Annie E. Fitzgerald, "Occasia Owen," Alice Mason, William Simpson, Chas. F. Stoddart, "Ina," H. C. Williston, "Albion," "Fairfax," Bonaevel, Mary Kyle Dallas, Margaret Hosmer, and many other accomplished writers of Fiction, Romance, Novels and Stories, Poetry, Essays, Sketches, etc., etc., comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

Take care to write distinctly the name of the person; the name of the city, town or locality where the Post office is situated, and the name of the County and State, in order that the paper may be fully and accurately directed to every address.

THE GOLDEN ERA TO CLUBS.

Parties (living remote from localities where agents are located) forming a club of five yearly or half-yearly subscribers, and forwarding the subscriptions (by letter registered and postage paid) to the office of publication in San Francisco, will be entitled to an additional copy of The Golden Era for the term of one year, or to retain the equivalent in cash.

AGENTS in every part of the State receive subscriptions or the Golden Era.

POSTMASTERS in California, Oregon, and neighboring Territories, obtaining subscriptions for the Golden Era and forwarding the same, with name and address of the subscriber, will be allowed a commission therefor.

PARTIES residing in localities where no Agents are established will forward their subscriptions by mail.

SUBSCRIBERS will be careful in writing as plainly and fully as possible, the direction of papers to be sent to any part of California, the Atlantic States, or elsewhere.

Now is the Time to Subscribe.

TO ADVERTISERS!

Best Advertising Medium—The "Golden Era" is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village, and mining and agricultural precinct in California, and offers unusual and unequaled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as these of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

GOLDEN ERA POSTAGE.

Postage on the COLDEN ERA, to Mail Subscribers, in California and throughout all the States and Territories of the Union, per quarter, (3 months).... 5 cts. To be paid quarterly, in advance, either at the Office of Mailing or Delivery.
Postage on the GOLDEN ERA, Single Copies, transient, to be prepaid by stamps..... 2 cts.
Postage on the GOLDEN ERA, to Mail Subscribers in the county (San Francisco) where published..... Free.

TO MAIL SUBSCRIBERS.

The Golden Era, for One Year..... $4 00
The Golden Era, for Six Months..... $2 00
The Golden Era, for Three Months..... $1 00

Subscriptions to be Paid in Advance.

BROOKS & LAWRENCE,
Golden Era Building,
543 Clay st., near Montgomery, San Francisco.

Language of the Star Spangled Banner.—The stars of the new flag represented the constellation of "States" rising in the West. The idea was taken from "the constellation Lyra," which, in the hands of Orpheus, signified harmony. The blue of the field was taken from the edges of the Covenanters' banner in Scotland, significant also of the league and covenant of the United Colonies against oppression, incidentally involving the virtues of vigilance, perseverance and justice. The stars were disposed in a circle, symbolizing the perpetuity of the Union; the ring, like the circling serpent of the Egyptians, signifying eternity. The thirteen stripes showed, with the number of the United Colonies, and denoted the subordination of the States to the Union, as well as equality among themselves. The whole was the blending of the various flags of the army and the white ones of the floating batteries. The red color, which in Roman days was the signal of defiance, denotes daring; and the white purity.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Information Wanted.—A letter mailed at Nevada City, Cal., about January 28, 1865, signed by Jas. R. English, and addressed to this office, has failed to reach us, and we hereby offer a suitable reward for any information which may be given us of its whereabouts.

8v10 **DEWEY & CO.**

The "Mining and Scientific Press" is an excellent journal, and ought to be subscribed for by every miner and artisan on the Pacific coast.—*Nevada Daily Gazette.*

District, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 24th day of February, 1865, an assessment of twenty-five cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 1st day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 15th day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

C. B. TOWLE, Secretary.

Office, S. W. Corner of Stockton and Washington streets, San Francisco. fe25

POSTPONEMENT.—The advertisement of stock delinquent on the above assessment is hereby postponed until Saturday, April 1st, 1865, and the sale thereof until April 15th, 1865. By order of the Board of Trustees.

mar25 C. B. TOWLE, Secretary.

SPAIN, some three centuries ago, on account of her commerce, was the mistress of the seas; but want of attention to business education soon ruined her. Aspiring youths of America, learn a lesson from her, and take a course of instruction at the Pacific National Business College, conducted on the London Corn Exchange principles.

New Year Diggings Gold and Silver Quartz
Mining Company, Tuolumne County, California.

Notice.—There are delinquent upon the following described Stock on account of Assessment levied on the 3d day of February, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the 17th day of March, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at Edwards, Olney & Co.'s, No 626 Montgomery street, San Francisco, on the 1st day of April, 1865, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

AUG. KUNAST, Secretary.

Office, No. 540 Washington street, San Francisco. mar18

Ontario and Webster Gold and Silver Mining
Companies, Montgomery District, Mono county.

Notice is hereby given that at a meeting of the Board of Trustees of said companies, held on the 16th day of February 1865, an assessment of fifty cents per share was levied upon the capital stock of each of said companies, payable on the 20th day of March, 1865, in United States gold and silver coin, to the Secretary, at his office, No. 571 Mission street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 3d day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. B. SHELDON, Secretary.

Office, No. 571 Mission street, San Francisco.

N. B.—This assessment includes one of 25 cents per share, levied on the 26th day of May last, and all stockholders who have paid that assessment will be credited the amount of such payment on the presentation of the receipts for the same. [7] H. B. SHELDON, Secretary.

POSTPONEMENT,—The advertisement of Stock delinquent on the above Assessment is hereby postponed unill Saturday, the 25th of March, 1865, and the sale thereof until the 10th of April. By order of the Board of Trustees.

11v10 H. B. SHELDON, Secretary.

By order of the Board of Trustees.

I. T. MILLIKEN, Secretary.

Office, 608 Merchant street, San Francisco, Cal. mar18

THE MINING AND SCIENTIFIC PRESS.—We call the attention of our readers to an article from this valuable journal, explaining some of the reasons why it should be supported. We have no hesitation in saying it is one of the most deserving publications on the coast, in fact, the only legitimate mining journal in California. Every practical pick and shovel miner, as well as every man who may be, anywise interested in mining, should have the *Press* for his own information, aside from its scientific value. Its editors and contributors are men of practical experience and qualified to speak that which they know.—*Grass Valley Union.*

A VALUABLE NEWSPAPER.—The "Mining and Scientific Press," published by Dewey & Co., in San Francisco, is a useful and instructive journal for the miner and mechanic offering a vast fund of information respecting the working of metallic ores, the improvements in mining and other machinery, etc., etc. The Press deserves a liberal support from miners and artizans. Terms—$5 per annum, or $3 for six months.—*Placer Herald.*

Santa Cruz Petroleum Oil Works Company,
Santa Cruz County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 23d day of February, 1865, an assessment of forty cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 53 Montgomery Block, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 1st day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 17th day day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

W. FELL, Secretary.

Office, No. 53 Montgomery Block, San Francisco. mar4

Southern Light Gold and Silver Mining Company, Reese River Mining District, Lander Co., Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 27th day of February, 1865, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable on the 28th day of February, 1865, in United States gold and silver coin, to the Secretary, J. A. Drinkhouse, or to H. L. DAWLEY, Superintendent, at Austin, Nevada.

Any stock upon which said assessment shall remain unpaid on Saturday, the 1st day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Wednesday, the 19th day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. MINING BLANKS

For Sale

AT THE

OFFICE OF THE MINING AND SCIENTIFIC PRESS,

Nos. 11 & 56 Government House.

Blanks for Mining Companies, Secretaries, Shareholders and others, always on hand, or printed to order, at our office.

San Francisco Prices of Copper Ores.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton		Per ton
12 per cent. ore	$24 00	22 per cent. ore	65 35
13 " " "	28 50	23 " " "	69 10
14 " " "	33 00	24 " " "	72 90
15 " " "	37 50	25 " " "	77 20
16 " " "	40 80	26 " " "	80 70
17 " " "	45 10	27 " " "	85 00
18 " " "	49 40	28 " " "	89 10
19 " " "	53 70	29 " " "	93 25
20 " " "	58 00	30 " " "	97 50
21 " " "	61 70		

To calculate the value of ore which assays 30 per cent. and upwards, multiply the per centage by $3.25, and you have the price which will be paid. For instance—suppose you have ore which assays 35 per cent.—multiply 35 by $3.25, and you have $113.75 as the value of the ore. These prices, we believe, will be found substantially correct, and can always be realized.

MINING PRESS.—The San Francisco *Mining Press* has entered upon its tenth volume, and bears evidence of increasing prosperity. Dewey & Co. have, by untiring industry, made the *Press* one of the leading papers of the State, and as a mining journal it has no superior in the country. Those interested in the mines on this coast can make no better investment of five dollars than by subscribing to this excellent journal.—*Alpine (Markleeville) Chronicle.*

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address **J. MOSHEIMER,**

BRASS AND BELL FOUNDER,

Cor. Market and First Sts., opposite Oriental Hotel,

SAN FRANCISCO.

Manufacturer of Brass, Zinc, and Anti-Friction or

Babbet Metal Castings;

CHURCH AND STEAMBOAT

BELLS,

TAVERN AND HAND BELLS AND GONGS,

FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles,

HYDRAULIC PIPES AND NOZZELS

For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

☞ Highest Market price paid for OLD BELLS, COPPER AND BRASS. ☜ 6tf

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Blanks.—We furnish Secretaries gratuitously with correct blanks for advertising assessment notices, delinquent sales, postponements, etc.

Economy In Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE-HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

THE ORIGIN OF PETROLEUM.

It has been truly and forcibly said that the genesis of petroleum has not yet been written. The possible source of the vast supplies of this oleaginous fluid has been much discussed within the past three or four years, and the subject has been examined and considered by some very intelligent minds; but up to the present time science has not been able to collect and collate a sufficient number of facts to lead to any very intelligent or definite conclusion. The peculiar manner in which this new article of commerce is brought within the reach of man is not calculated to enable the investigator to so readily avail himself of the usual lights of science, so effectual in most examinations of the products of the earth and their immediate surroundings. The precious metals, and the still more valuable deposits of coal, iron, etc., are brought to the surface only by extensive excavations into their hidden recesses. The miner must work his way down in pits and along galleries, where the scientific investigator can also follow and examine minutely as he goes along, every foot of the various strata through which he passes, and read as he goes the various pages of the book of Nature, enstamped, as they always are, with the unerring evidences of their origin and their order. Not so, however, with the remarkable product of which we are now writing. In obtaining it we stand upon the very surface of the earth, and stretch down our long arms from a few hundreds to thousands of feet, into the dark caverns below, where the light of neither sun or candle has ever revealed to man ought but the product itself, which we are seeking, the nature of which is such as to allow its voluntary ascent or ready extraction without our actual presence at the seat of its deposit. The uncertain evidences which the auger and drill bring to light, are quite too vague and limited to admit of any definite conclusions except upon the most careful and extensive comparisons, which must draw largely upon all the resources of both geology and chemistry. Sufficient time has not yet elapsed to combine and compare. Active minds are, however, busy in studying the phenomena upon the true understanding of which rests the intricate problem, the solution of which will doubtless come, in good time, to gratify the laudable curiosity which is now so universal, to know something of the origin and history of a material which has so suddenly worked its way into the every-day life of half the civilized world.

We have already, from time to time, given our readers a chapter in this interesting history, as materials and facts have been presented to our notice. We shall still continue our efforts in that direction, and suffer no material fact to come before the world, in any quarter, without giving it in full or in substance in the columns of the MINING AND SCIENTIFIC PRESS. We have already, in past numbers, given the geology of petroleum, as it has been presented to the world by the most careful and observing minds of the Atlantic States. We have not yet seen anything to seriously conflict with what we have already published, or anything of material importance to add thereto. It has been our aim to throw out a few hints which might be of service to prospectors in this direction; but the conditions under which this product occurs in this State, being apparently somewhat different from those which attend its occurrence at the East, and our geological knowledge of its location here being less understood than its localities there, we have concluded to defer any further remarks in that direction until personal observation and the numerous researches now in progress have placed at our disposal facts such as shall be of substantial value to communicate.

In a former article we alluded to a theory of its formation based upon a chemical union between the carbon contained in the lime-stone, which is always found in close connection with oil deposits, and the hydrogen of the water always present. The objections urged against this theory are far from being conclusive, inasmuch as the modes of decomposition to which carbonic acid may be subjected are as yet but imperfectly understood. Just how, when or why the supposed transformations took place, to accomplish this change, cannot now be known; for in the vast laboratory of Nature beneath our feet, changes may be constantly taking place, based upon principles yet unknown to man, but which may nevertheless be discovered and well understood in the future. In all investigations of this character it is well to bear in mind that our knowledge of God's workings is still imperfect; but that the changes and combinations which are produced by the Almighty chemist are conducted by faultless wisdom, and often in ways mysterious and past finding out.

Another class of investigators have arrived at quite a different conclusion, and assume that the origin of petroleum must be due, in some way, to the decomposition of woody matter, enormous quantities of which, all geologists agree, must have been produced during the carboniferous period, or that which immediately followed the first cooling of the earth's crust, when tropical fruits were probably due more to internal warmth than to the heat of the sun, as now. Those who hold to this theory appear to place the era of the vegetation out of which petroleum was formed, anterior to that which produced the coal deposits; and furthermore, that petroleum was derived from a foliaceous rather than an arborescent growth.

If we are not mistaken, they also interpose a saliferous period between the coal and oil. A writer in a late number of *Harper's Magazine* argues that petroleum was formed exclusively, or at least chiefly, from marine plants; a position quite untenable. The interposition of a saliferous period, between coal and oil, is much more probable, from the fact, which we believe is almost invariable, that salt or salt-water is always found overlying the oil.

Much weight, in favor of the vegetable origin of oil, appears to be derived from the absence of any appearance of animal life during the earlier periods of the carboniferous era, and from the generally acknowledged fact that the excess of carbon then contained in the atmosphere in the form of carbonic acid, was such that no air-breathing animals could possibly have existed at that time; while immediately afterwards, and during the time of the deposit of the upper coal measures, we begin to find the lower types of animal remains. It is assumed that the extraordinary foliaceous vegetation which existed during the earlier carboniferous periods absorbed this excess of carbon and deposited it again in the shape of oil, while the firmer arborescent vegetation of a later growth was solidified into the condition of coal. Plants, we know, derive the chief part of their carbon from the carbonic acid of the atmosphere, and the more luxuriant the vegetation, or the greater the amount of leafy surface presented, the greater the absorption of carbon. The immense deposits of limestone, which appear to be contemporaneous with, or immediately precedent to, this early vegetation, doubtless aided or perhaps were the principal agents in this purification of the atmosphere, which was an indispensable pre-requisite to the appearance of animal life.

Might it not thus have been among the wonderful events in the progress of creation, that an element so destructive to animal life as carbonic acid, was thus brought into existence for the very purpose of being metamorphosed into a more useful form, and so placed in the great store-houses of Nature, as to afford, at this day, the greatly increased need for artificial light and heat which the world is now beginning to realize?

PRESSURE OF THE ATMOSPHERE.—It can readily be proved that the pressure of the atmosphere is about fifteen pounds on every square inch of the earth's surface; and if, starting from this well-known fact, you calculate the amount of pressure on any extended surface, you will be astonished at the result. For example: the pressure exerted by the atmosphere on the area on which a building stands is vastly greater than the whole weight of the building itself. The pressure on the whole surface of a man of ordinary stature is about sixteen tons; that on one square mile of surface is equal to over twenty-six millions of tons. How great, then, must be the pressure on the whole surface of the globe! or, what is the same thing, how great is the intensity of that ever acting power which holds the atmosphere in its appointed place! Yet this force, immense as it is, is so delicately balanced by the sweet influences of the sunbeam that it does not so much as shake the aspen-leaf or break the gossamer. If we believe no more than this, that the world was once created by God, what must be the power and wisdom of a being who could appoint these mighty forces and adjust them with such perfect precision? But if we also believe that these forces are direct emanations of divine power—that it is God himself who, with his own right hand, so to speak, holds the atmosphere in its place and appoints its bounds—then all Nature assumes a more glorious aspect, and we feel that we are indeed surrounded by the divine presence.

RICH ROCK.—Mr. M. L. Smith, of Bend City, Owens river, has left upon our table a quantity of the richest quartz rock we have ever seen, except after a very close selection, taken from the "Golden Cross" and "Josephine" lodes, Alabama District. This mining district is on the Western side of the Valley, in the Sierra range of mountains. It is the deliberate opinion of good judges of auriferous rock that they have in this district of mining country the best rock, and most of it, of any place on this Continent. If the general average is anywhere near ten per cent. of these samples, the opinion is well founded certainly. Persons interested are invited to call and examine.—*Visalia Delta.*

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

THE AGE OF GOLD-BEARING ROCKS.

[By Thomas Rowlandson, Fellow of the Geological Society, London.]

NUMBER TWO.

AN EPISODE.

The object in re-publishing an almost verbatim copy of an article which appeared in another journal nearly two years ago, it may perhaps be well to explain; the writer will endeavor to do so. The preceding article was hurriedly written on the morning of a day on which he had engaged to proceed to Tuolumne county. It was merely intended as an introductory paper, and the hypothesis so strongly set out in that paper, to be supported or disproved, according as circumstances and facts might transpire, calculated to strengthen or detract from the value of the novel theory propounded therein, as respects the Age of Gold-Bearing Rocks. At the time the opinions under notice were first set forth, there existed every reasonable ground for believing that it was quite new. How these views were arrived at would require a very lengthened explanation, and would involve a complex investigation, with regard to the theory of metallic mineral veins, generally, and at least an attempt at reconciling their various attendant perplexing anomalies. The arduousness of the task implied in the latter branch of the inquiry alone, can only be fully understood by those who have, for a long period and closely, studied the phenomena accompanying this deeply interesting, and hitherto mysterious, scientific question.

It has already been related in what manner a former series of papers on the same subject was commenced; it will hereafter be stated why it is now resumed, and also why the bulk of those originally published varied from the plan originally conceived.

Having a little time to spare between leaving the copy of the paper, already noticed, with the editor of the *Alta*, and the departure of the Stockton steamer, I availed myself of the opportunity to wait upon the State Geologist, at his official office, in San Francisco, to ascertain, if possible, more minute particulars respecting the spirifer already noticed, and also to learn whether any additional organic remains had been discovered calculated to throw additional light upon the subject under inquiry. I found the State Geologist in company with Mr. Gabb, and explained to Prof. Whitney the object of my visit, namely: My desire to learn further particulars respecting the spirifer so frequently noticed; upon which I was referred, by Prof. W., to Mr. Gabb, who obligingly gave me all the information he possessed on that subject, which was to the effect that it (the spirifer) was found unaccompanied by other fossils in limestone rock, near Shasta; that the age of the rocks in which it was found had not been worked out, though his own opinion, at that moment, was that it would prove of what was usually called the carboniferous period, an opinion with which I was fully inclined to coincide, from the fact that I had long previously assigned, though possibly erroneously, a like age to rocks of similar lithological character, in Tuolumne county, which are so well developed beneath the auriferous alluvium around Sonora and Columbia, to which vicinity I was about to proceed, and for the purposes of which visit it was doubly interesting for me to obtain all the information which I could legitimately seek or attain.

That matter being exhausted, I made inquiries as to whether any notable discoveries of fossils had been made, calculated to elucidate the question as regards the age of the rocks composing Telegraph Hill; the lignite beds lying a little to the south of that locality, and particularly as regards the age of the rocks enclosing the celebrated cinnabar veins at New Almaden. The last query, if I remember right, was prompted by some discoveries having been a short time previously made, of metallic quicksilver, in the course of excavating a reservoir for the Spring Valley Water Company, in the vicinity of the Orphan Asylum; and also from the circumstance that two or three years anterior to the period under notice I had observed in my rambles in the vicinity of this city, to the southwest of the point alluded to, the indications of mineral veins, apparently developed in a very marked manner. To all these questions I was informed that no well defined and well established palæontological specimens had yet been discovered, which could be relied upon as definitely settling the age of the rocks, respecting which inquiry was made. This may have been the case, and the conclusions arrived at by the State Geologist, and published in Silliman's journal, may be based possibly upon subsequent discoveries.

Up to this period in the interview there did not appear to be any disinclination to afford every facility and information desired. I then named to Mr. Gabb, addressing that gentleman personally, but close to and in the hearing of Prof. Whitney, that one of my chief objects in calling was more especially to ascertain whether any additional palæontological evidence had been obtained, beyond that afforded by the spirifer, already noticed, which was calculated to elucidate the age of the gold-bearing rocks of California; naming, at the same time, that I did not concur in the theory so generally accepted, that it was only in the older and commonly called silurian strata, that auriferous veins of notable richness could be found; adding, that from lithological evidence, the only kind which I personally possessed, I was strongly impressed with the conviction that so far as California is concerned, some of the richest gold mines would probably be found in rocks of very modern age, probably as late as the tertiary.

I had scarcely given expression to the preceding, when Prof. Whitney very peremptorily directed Mr. Gabb not to afford me any further information, accompanied by the remark that the age of the gold-bearing rocks was a very important and interesting subject, and he was not going to allow information to be obtained from his office with the object of being introduced into articles for newspapers. I had stated that I was about to draw up some papers in relation to this subject, though I did not state that the information sought was intended for the California or any other daily or weekly press; for aught Prof. W. knew, I might have intended my projected paper for some scientific magazine, or to be read at the London Geological Society. Admitting, however, that Prof. Whitney was right in his conjecture that my proposed lucubrations were intended for the newspaper press, and also for any particular member of the California press, it may be asked: "Does such a circumstance form any reasonable ground for withholding information, gathered at the public cost, for a public purpose, when sought for, in a respectful manner, and for an object in the correct elucidation of which every member of this community is deeply interested." Had it been intended to glean from the officers of the State Geological Survey a mass of information, and then to publish the same either anonymously or otherwise, without acknowledgment of the obligation under which the writer had been to those from whom he had derived his information, there might have been some reason for such reticence; but Prof. Whitney was assured by me that any communication made to me would be publicly acknowledged and in the amplest manner—all to no use; the refusal was persisted in, and when pressed for the grounds for doing so, I was informed that he was prohibited from giving any information by an act of the Legislature. The consistency of this, with other actions of the State Geologist, and its prudence or folly on the part of the Legislature must be left to be inquired into in another article.

Waste of Metals in Coin.—The various coins which are in circulation are constantly wearing out, and with rapidity for which many persons would hardly be prepared. Parliament acknowledges the fact of this wear and tear, by voting ten thousand pounds annually to the mint to indemnify it for the loss to which it is exposed, on account of being obliged to receive silver coin, however worn, at its nominal value; of course it would be unfair that the last possessor of the coin should suffer from a diminished size to which thousands of others have contributed. It is curious that the smaller the coin the more rapid the deterioration. Thus, crown-pieces are found to lose five per cent. in ten years, half-crowns twelve per cent., sbillings thirty per cent., and sixpences forty per cent. Gold coin—being more carefully handled and carried about, and rarely let loose in the pocket—does not wear out near so fast as silver.—*English Journal.*

Many of the Jews of this country have shown much patriotism since the war began. From Ohio 12,000 have gone to fight for the Union flag; from New York 10,000; from Illinois, 5,000; from Michigan and Wisconsin 3,000; and from other States enough to make a total of 40,000. They have also given of their wealth to the soldiers. They have established five asylums for disabled soldiers, their widows and orphans, the benefits of which are limited to no faith or creed—one at New York, one at Philadelphia, one at Cincinnati, one at Chicago, and one at St. Louis.

Further about Amalgamating Copper Ores.

Editors Mining Press:—In Mr. Jennings' remarks on the re-actions of chloride of iron on oxyd of copper, as given by "C. A.," he adopts the notion that protoxyd of iron and hydro-chloric acid were the chemical results of a decomposition of the chloride of silver by metallic iron; denying at the same time the formation of proto-chloride or muriate of iron. Considering the facility with which protoxyd of iron dissolves in hydro-chloric acid, this is simply an impossibility. Furthermore, if the muriatic acid, so formed, is not combined with the protoxyd of iron, as a muriate of iron, would it not form a proto-chloride with the metallic iron present; particularly when heat is applied?

The absence of hydro-chloric acid in the test-tube holding the original chloride of silver, water and iron, after the decomposition of the chloride of silver, is easily proved by the fact that the hydrated protoxyd of iron, precipitated by a trace of aqua ammonia, is not re-dissolved again. As no other solution of protoxyd of iron could be present, the precipitate by aqua ammonia could indicate only the presence of chlorido of iron; no further re-agent being needed.

Furthermore, by using a solution of proto-chloride of iron containing no trace of free hydro-chloric acid, adding oxyd of copper, Mr. Jennings will find that chloride of copper is formed, notwithstanding.

If any further proof of the correctness of the above re-actions, as given by "C. A.," were required, the successful application of chlorides of iron, for the purpose of forming soluble chloride of copper in working oxydized poor copper ores, will amply furnish it.

At Linz, no metallic iron is used to decompose the water for the purpose of forming hydro-chloric acid, a dissolvent of the oxyd of copper.

We see, by carefully considering the above re-actions, that the method proposed by Mr. Jennings of extracting the soluble chloride of copper previous to amalgamation, in order to get amalgam free from copper, is insufficient for that purpose, as there is always oxyd of copper and a basic sulphate of copper (Cu^3 O SO^3) left after a perfect chlorating roasting, even if the salt is added to the ore from the beginning of the roasting.

Using Cumenge's process of roasting with steam, with exclusion of air, the disadvantage of forming a cuprous amalgam is avoided. For antimonial and arsenical ores also, Cumenge's process deserves more attention. It may be of interest to state, in this connection, that Rivot's process is a modification of Cumenge's.

Yours, Deetken.

The Process of Embalming.—W. H. Mussey, late Medical Inspector, U. S. A., finds that the charges for embalming bodies in the army are so exorbitant compared with the actual cost of the process, that he has been induced to present to the profession the following note upon the subject. He says:

Whilst in North Carolina last year, an old friend whom I found there died. He was a chaplain. His family being in moderate circumstances, I thought, to save the expense of embalming, I would do it myself, and took chloride of zinc, 1 oz; arsenious acid, 2 drachms; warm water, 1 gallon. The chloride of zinc was dissolved in water, the arsenic in alcobol in a mortar, and the articles mixed in the warm water, and injected into the femoral artery by means of an ordinary elastic gum syringe, the compression of the ball affording sufficient force, and a continuous stream was thrown upward until about one pint remained, when the nozzle was turned, and the limb injected.

The result was, that when the body was interred in Massachusetts, and the features were exposed, they were perfectly natural, with a blush upon the cheeks. The sooner after death that the injection is made the more perfect will be the state of preservation. A medical student or a hospital steward with but little instruction would soon become an expert in the process. The actual cost of the material is not more than fifty cents. The charge for embalming is from twenty-five to two hundred dollars.

A Chinese company recently bought a mining claim near Grass Valley, for which they paid $12,000.

Important Mining Decision.

The Virginia *Union* contains the decision of Judge Burbank, in the case of Robert Apple *vs.* the Alpha Gold and Silver Mining Company and B. F. Hastings & Co., rendered in the District Court. The decision occupies three columns and a half of the *Union*. It is a decision, says the Gold Hill *News*, which will strike stockholders in mining companies with alarm; and, if affirmed by the Supreme Court, will cause a very general revision of the organization of mining companies in this State. It seems to divest stockholders of all control over the business of mining companies, and to leave them entirely at the mercy of the Trustees. The character of the suit is set forth in the decision:

Certain executions had been obtained against the Alpha Gold and Silver Mining Company, in favor of B. F. Hastings & Co., and others.

The Sheriff having these executions in his hands, levied the same upon the property of said company, the same being a mining company framed under and by virtue of an Act of the Territorial Legislature, which Act was passed December 20, 1862.

While the Sheriff was taking steps to sell said property, application was made to the Court for an order restraining said Sheriff from selling said property.

The complaint sets forth certain reasons or causes why the Sheriff should be enjoined from selling the property. It alleges that said executions were issued upon judgments obtained upon certain notes of hand, purporting to have been made by the officers of said company; and further alleges that neither said company nor its officers had any authority to make and execute such notes, and that the making of such notes being unauthorized they were void; that the company property should not be sold to satisfy a judgment and execution obtained upon such notes.

It was further alleged that the by-laws of the company prohibited the company from contracting debts which in the aggregate should, at any one time, exceed the sum of ten thousand dollars ($10,000), and that the conveyance in trust by the stockholders to the trustees of the company limited the indebtedness which could be created against the company to ten thousand dollars ($10,000). It is further alleged that B. F. Hastings & Co., at the time of receiving said notes, knew of the restriction. That B. F. Hastings & Co. had consented that the judgment of Livingston for twenty-five thousand dollars ($25,000) against the company should have priority over their executions.

Upon that application the Court granted a temporary order restraining the Sheriff from selling the property.

To this complaint a demurrer was interposed. A motion was also made to set aside and revoke the temporary restraining order. The Court is called upon to decide this motion.

The substance of the demurrer is, that if the allegations in the complaint are true, still the notes are valid, and also the judgment, and that the executions should be collected out of the company property.

This is an equity proceeding. If the notes were valid notes against the company, binding the company's property, then the restraining order should be revoked; otherwise it should not.

Judge Burbank finds that the power to enact by-laws for the government of the company affairs is vested in the Board of Trustees, and that by-laws enacted by the stockholders are void; and the editor of the *Union*, in commenting thereon, says:

The restrictions, therefore, usually adopted, limiting the amount of the indebtedness that may be incurred, and the amount and frequency of levying assessments are of no force. This would seem to take all power from the stockholders to protect themselves from being frozen out or swamped by their Trustees. The decision in this particular case is:

If the Board of Trustees of the Alpha Company executed said four notes of hand, or caused them to be executed, or ratified their execution, and if said notes were given for a good and sufficient consideration, and if that consideration was received by the company, then and in that case the notes are good and valid notes, and upon them the company may be sued, judgment had, execution issued and the company's property levied upon and sold in satisfaction of the judgment. * * The result of my consideration of the motion is, that the motion to vacate the restraining order be sustained, and the order is accordingly set aside.

Two hundred acres of land have been planted with cotton the present season in Tulare county.

[Written for the Mining and Scientific Press.]

Mines and Mining about Drytown.

Messrs. Editors :—Mining in this vicinity is being prosecuted quite vigorously. We have an abundance of water, and placer miners are to be found in almost every gulch and ravine. Our placers are worked chiefly by Italians and Chinese, and judging from the faithful manner in which they labor I should think their toils were well rewarded. The production of gold by these people is quite an item in Amador county.

The attention of the American people here is turned to the more substantial branch of quartz mining, which forms now the principal support of this part of the country. There are several rich mines within two or three miles of town, all located on the Drytown ledge. This ledge is supposed to be, and no doubt is, a continuation of the Sutter ledge. It can be traced for a great distance, and appears to be the mother ledge of the country, bearing the same relation to this district as does the Comstock to the Washoe mining region. The lode runs nearly north and south, and is incased between a fine talcose slate foot wall, and a granite hanging rock, thus proving it to be a true fissure vein. The lode is well defined, varying in width from six to sixty feet. It carries a fine, lively, gold-bearing quartz, spotted throughout with a yellow decomposed quartz, bearing free gold ; there is also a large per cent. of sulphurets in the rock, of which but little account is taken, the free gold only being saved. [Our Drytown friend should bear in mind the fact that many gold-bearing veins carry the chief part of their gold in the sulphurets—that when worked for free gold, alone, they will not pay expenses, while by concentrating and working the sulphurets, a handsome yield is realized.—Eds. Press.]

I had the pleasure of visiting the Seaton mine, a few days since, situated on this ledge, and about a mile, in an easterly direction, from town, where I met Mr. Seaton, the superintendent, whom I found to be quite an energetic and intelligent man, and very accommodating. This mine, although not much spoken of, is very rich, and will compare favorably with the richest of the Gold Hill mines, in Nevada. The ledge at this point is from fifty to sixty feet wide. It has been worked on the foot wall some two hundred feet in length, and they are now taking out good pay ore, twenty-eight feet from the foot wall. This company have a fine twenty-stamp mill, run by water-power, where they reduce from twenty-five to thirty tons per day, at a cost of about three dollars and a half per ton.

There are extensions on the north and south of this mine which prospect well, and I have no doubt that with the expenditure of a little labor and capital, they can be made paying mines in a short time. Farther north, is the Webster and Potosi mines, both paying well ; then comes the Hooper, or Plymouth, which is quite rich and has paid well from the surface, some nine hundred feet in depth, where it increases in extent and richness. This company has a very fine mill, with amalgamating pans for reducing the sulphurets. I was told by Mr. Hooper the superintendent, that there was a sufficient amount saved from the sulphurets to pay all the expenses of working the mine.

I found also, on inquiry, that there are quite a number of copper mines in this county, which prospect well, have well defined walls and have been worked quite extensively. Some had even begun to ship ore to Europe ; but they all went down with the general crash ten months ago, with the exception of the Consumnes Company, which is the only one now in operation ; and even this does merely enough to keep alive. There appears to be a general lack of confidence throughout the country, which only needs to be restored, when with the expenditure of a comparatively small amount of capital a large number of mines might be so handled as to yield rich dividends.

Miner.

Chinese Miners in Shasta County.—The Shasta *Courier* of March 18th says :

In Lower Springs Mining District, the Chinese have for a long time been excluded. Recently the miners having become disgusted with working for small pay, and with a limited supply of water to work with, held a meeting and voted that Chinamen might come into their district and work any claims they could buy, and no more. On last Monday another meeting was held, and the laws so amended as to admit Chinese to come in on equal terms with others. This is as it should be, and these diggings will now produce ounces where heretofore only dollars were extracted, and will add largely to the revenue of the county.

Copper and American Copper Mines.

It is an interesting and curious fact that the price of copper increases with the increase in production. Thirty years ago when the aggregate production of all the mines in the world was but 25,500 tons annually the price in the chief markets was but $350 per ton. From that time to 1855 the yield gradually rose to 55,000 tons per year, and the price to from $450 to $475 per ton. It is now $500, and the annual yield not less than 70,000 tons, which gives $34,000,000 a year as the price of the copper production of all the world. The annual gold production of all the mines in the world is not three times as great as this amount. Why the demand exceeds the supply of this metal is answered in the great usefulness of copper, and the multiplicity of uses to which modern civilization, science, art and discovery apply it : as also to the additional fact that the mines of the Old World are beginning to fail, or at best have to be worked at far greater cost in the production of a ton of copper than they were thirty or forty years ago. From copper and zinc we make brass, which enters into every metalic art, from the manufacture of a watch or kettle to a cannon. Of copper and tin we make bell metal and the bronze of statues. Tons of copper are used up in currency both in Europe and America. It is mixed in the composition of knife handles, ornaments to harness, and enters into the service of every household or trade or art from the highest to the lowest.

But what absorbs most of it is the ships of commerce, all of which must be "copper bottomed," and so, just as commerce expands, the copper market will enlarge. Hence the recent discoveries of copper in America obtain even greater importance to the world than all our gold and silver production. The world might manage to get along without gold or silver. They are of little intrinsic worth. But next to iron, copper is the most useful and indispensable metal.

Up to the year 1863 Great Britain and Chili furnished more than half the copper of the world—about 14,000 tons each, yearly. At that time the United States produced but 2,000 tons. Cuba, Austria, Australia, and Russia were all ahead of us. Our mines were poor and scattering. In 1853 the Lake Superior mines began to attract attention and capital. In 1857 the Lake Superior mines yielded about 5,000 tons of pure copper, valued at about $2,000,000. In 1864 the yield was 14,000 tons, valued at $7,000,000 ; or one-fifth the value of the whole world's copper production of 1853. These mines are not yet fairly opened, and judging from the interest manifested in them by the newspapers of Chicago, and from their rapid increase in production for the last three or four years, it is not at all extravagant to estimate their annual yield ten years hence at $20,000,000 ; full half as much as the yield of the gold mines of California in the year 1864, and four-sevenths as much as the copper yield of all the world in 1852. But California and Arizona promise fairly to surpass Lake Superior within the next decade. There is perhaps no mine in America as productive as the Union mine at Copperopolis will be in a year or two more, when all the company's arrangements for turning to profitable use their inferior ores shall be completed. The success of the Union mine in this respect will be shared in a great measure by other copper mines in the State, and the name of our copper mines is legion. They are being developed in every county from the Klamath to the Colorado and Gila, and from the Sierra Nevada to the sea. In England they work and make a profit out of two per cent. ores. Here, so far, nothing below twelve per cent. ore has paid. With railroads, smelting works at the mines, and capital, we can even in California profitably work five and six per cent. ores ; and whenever that point is reached, this State and Arizona will yield annually from thirty to forty millions of dollars' worth of copper bars. Hundreds of mines are impatiently waiting on these three things : capital, smelting works and railways to convey their ores cheaply and rapidly to the furnace.—*Stockton Independent.*

Wendell Phillips on Edward Everett.—In a recent speech, Mr. Phillips spoke of Mr. Everett as one of the new converts to the theory of progress in politics, adding : "And when I name Edward Everett I desire to say that I name the cap-sheaf of American magnanimity for the last three years. I know of few men in any age or language who at near seventy years of age, with such a career behind them, had the loftiness to stand before twenty millions of their countrymen and say, 'I was mistaken.' Such men are rare in any age, and certainly deserve fair credit for such a confession. They are new converts."

The flames were unusually disastrous in 1864. Such fire statistics as we have, show a total loss by conflagration exceeding 28½ million dollars—where each fire destroyed $20,000 or more—a much greater aggregate than that of any year of the previous decade, and double, the figures of 1863.

ADVENTURES OF WARREN LELAND.

The readers of the New York *Herald* are already aware of the brilliant and glowing description of the mines of the Colorado, given in that paper, by Mr. Leland, soon after his late arrival, overland, in New York from California. A correspondent of the *Flag*, of this city, takes Warren down a peg or so after the following manner :

Leland may know how to "keep a hotel." I am rather inclined to think he does, as he has won a considerable amount of reputation and grand cash in the operation ; but some of his "adventures" verge upon fancy, though they sound well enough to uninitiated ears. It is not long since I followed Fitzhugh Ludlow on a tour through these parts, and was compelled to show, in justice to the salmon tribe, that they were not caught in November ; but I am inclined to believe Leland got home just in time to read the *Atlantic Monthly*, and seeing that the romantic Ludlow caught them at the Cascades, he claims to have caught them too. As both of these travelers had a November passage, I am sorry to say they had no salmon to spear there then. Leland stopped at Meacham's, on the Blue Mountains, spent one day hunting, and killed a "moose ;" which I respectfully declins to believe, because, having lived several years in those same mountains, I have never heard of "moose" until now. There are elk there, but not often found by the hunter, and probably not slain by Leland. Idaho City was so fond of theatricals that Mrs. Hayne was receiving $500 per night for playing there when Mr. Leland visited it. Now, that statement is utterly erroneous, and the traveler who so easily says night, when he means week, may expect to have a touch from critics. But Leland kept his eyes open for some facts of interest ; saw budding greatness in Idaho, and carried back an impression most favorable to the prospects of the Pacific, so we forgive his picadilloes.

If Mr. Leland does not stick any closer to facts in his account of the mines and mineral resources of Idaho and Colorado, than in the above "adventures," we are inclined to think his friends, the New York capitalists, will lose money by investing on his representations. Judging from his glowing description of the route, we should infer that he encamped every night in a clover-field, with a sky yielding lavender-dews, instead of upon alkali plains encountered by common travelers over those unhospitable regions. He appears to have seen nothing but gorgeous sunsets, and breathed only air of richest fragrance, emitted from silver censors. One would think the Indians, which others have found so troublesome, appeared to him of the most lamb-like dispositions, and never dared to shoot an arrow even at a wounded deer. The hotel king certainly has a most brilliant imagination, but he is a genial companion and a most excellent landlord ; hence, like the correspondent quoted above, we forgive his innocent flights of fancy.

Future Existence. — It is hard to think when the ties of kindred and friendship are linked around the heart—when intellect has achieved its lofty triumphs and has wound its power into song, and left it in sculptured beauty when the noble, the good, the loved, and the beautiful have passed to the grave—it is hard to think that we shall never behold them again : we cling to the hopes that sprang up amid these dark thoughts and tell us these things are so. We look for analogies in nature to confirm these hopes. We behold the mean, groveling worm of to-day transformed, on to-morrow, a thing of glory, that flutters in the beauty of a new and brightened existence, and we say, "then shall man die and live again." We hold the seasons of the sere leaf and falling fruit—the snow-wreathed hill and ice-bound stream, and when they pass, and when the glad earth rejoices again, and streams break their fetters, and the trees put forth their loveliness, and the flowers look up and smile at us, we exclaim—"Thus shall man, who fades away like the summer flower, or the autumn leaf, break from the bonds of death and exult in a new clime, where the sun never sets, and where all is bright forever."

It is stated that if ex-President Pierce, now journeying about the country, should include Washington in his tour, it will be the only instance on record of any ex-President visiting the national Capital after the close of his term, except in the case of John Quincy Adams, who resided there several years as member of Congress.—*Exchange.*

Gen. Washington, if we mistake not, visited the national Capital after his retirement from the Presidency, while the Capital was continued at Philadelphia.

Recipes.

Cheap Glue.—In extracting neat's-foot oil, which by the way, is unsurpassed by any other oleaginous matter for harnesses, shoes, etc., the watery liquid remaining, should never be thrown away. After the oil is taken off, strain the water to separate from any fatty particles that may remain, and then boil it again, until upon trying it is found it will settle into a stiff jelly. Then pour into flat-bottomed dishes, and when cold cut into suitable sized pieces. It hardens in a few days, and you will then have a very fine article of glue, free from impurities of every kind, sufficient for family use for a twelve-month. By taking a portion of this glutinous substance before it becomes too thick, and brushing it over pieces of silk, you will have just as much *court-plaster* as you desire, inodorous, tenacious, and entirely free from those poisonous qualities which cause (as much of the article sold by the apothecaries does) inflamation, when applied to scratches, cuts, and sores.

To Restore Tainted Meat.—If salted, wash it and throw away the brine, then replace it with the following composition, and allow it to remain in it for a few days : Fresh burnt charcoal, powdered, 12 parts ; common salt, 11 parts ; saltpetre, 4 parts. Mix. This is to be used the same as common salt. When the meat is to be cooked the black color may be removed with clean water.

Wine Sauce.—Two ounces of butter, two tea-spoonfuls of flour, half a pint of boiling water, a gill of Maderia wine, a quarter of a pound of sugar, half a grated nutmeg. Mix the flour and butter together, pour in the boiling water, let it boil a few minutes ; then add the sugar and wine. Just before going to table, add the nutmeg. Serve hot.

Baked Carrots are much sweeter than when boiled. A Hubbard squash when baked preserves its peculiar aroma and sweetness much better than when boiled. In northern latitudes it does very well as a substitute for sweet potatoes.

To Save Sugar in Apple Sauce.—Use half sweet and half sour apples. After washing, soak them separately over night, then stew them in the same water in which they were soaked. Put in the sweet apples first, and when they are tender add the sour ones.

Itching from poisoning or other causes may be relieved by rubbing with cloths dipped in water as hot as can be borne.

A New Fossiliferous Reptile.—Prof. Owen has given, in the Geological Magazine for January, an illustrated description of the remains of a new reptile, found in the coal-beds of Llantrissant, Glamorganshire. From the characteristic density and thickness of the walls of almost all the long bones hitherto observed of this air-breathing vertebrate, the Professor has named it "anthrakerpeton crassosteum." He concludes, from the evidence before him, that it belonged to that low, probably primitive, air-breathing type which, with some developmental conditions of the bones like those in some fishes, showed forms of the skeleton more resembling those in Saurian reptiles than are attained by any of the more specialised Batrachian air-breathers of our own time. This magazine also contains some interesting remarks of the present state of geological research, with special reference to the Eozoon canadense, the earliest created being hitherto known in palæontology.

Gold Fish.—We have been asked, "where do the gold fishes come from which are frequently seen in San Francisco?" In explanation we give the following, from the Sandwich Island *Commericial Advertiser* :

"These beautiful little animals, originally introduced from China, have become quite numerous here. They breed without any care or attention, and in enclosed small ponds increase very rapidly. There is no more beautiful ornament for a parlor, than a tastefully arranged aquarium, with these golden fish sporting and playing about the coral and shells. We observed that almost every packet leaving for California takes some gold fish, the trade in which seems to be regularly established. They are purchased to ornament parlors and drawing-rooms, and no house is now considered fully furnished unless it has a vase of gold fish.

An Old Resident.—It is said that a live frog, about an inch in length, was recently taken out of a piece of bituminous coal, in Erie, Pennsylvania. If the statement is correct, that frog must have been among the earliest animal organisms which appeared upon the earth, countless ages anterior to the appearance of man.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

San Francisco, Saturday Morning, April 1, 1865.

An active demand has prevailed for money this week in the general maket, and full rates were readily obtained—in Bank 1½ per cent. and on the street 2@3 per cent. per month. About one-half million dollars in coin have been used for the payment of custom duties by the merchants, some of whom are requiring means at this time for other purposes. Many speculative dealers in Legal Tender Notes are heavy borrowers at present, and considerable sums have been loaned recently by bankers upon this description of collateral. Operators in mining shares at current prices, also require additional facilities, owing to the late rise and the universal activity of the market.

Receipts of treasure from the interior since Saturday last amounted to nearly one million dollars, making an aggregate of five millions for the mouth of Mareh. Gold bars are in light request for Mouday's steamer, at about 780@800. Silver is selling at par to½ per cent. premium for bars of average fineness.

The stoek market this week has been strong, and with searce an exception all first-class shares were in good demand and actively dealt in at enhauced rates. Developments on the Comstock lode, throughout the entire length, coutinue to promise well for tbe future, and a number of claims are now thought to diselose more tangible evidenees of intrinsic value than at any former period. Several leading mines have so mueh improved recently as to warrant the expectation of increased mouthly dividends hereafter, while others seem to fully maintain their former prestige, and are yielding more thau was anticipated a short time since.

City stocks have been more active. California Steam Navigation Company was sold to the extent of 55 shares, deelining from $72½ to $66, advancing to $70, and closing at $71 bid. About 50 shares were sold within this range "between boards." Rumors are current as to tbe establisbment of a vigorous opposition to this eompany, but so far as we can learn, no movement of the kind has been seriously eontemplated as yet. San Franeiseo Gas was sold at $80, some 30 shares changing hands, and Spring Valley Water advaneed to $53½. City and County Bonds are unehanged and are well held. U. S. 7-30's were sold at 61½@61. Legal Teuders have been aetive and $412,000 were dealt in at the Board, advancing from 61 to 62e, receding to 61 and 60e, seller 30, and closing at 61¾ bid, 62c asked. In view of a much higher relative value in the East, with gold at not over 155 during the week, some surprise is expressed at tbeir abundanee in this market at the prices now ruling. It is intimated that the Sub-Treasurer in this city is quietly disposing of the million dollars received by him lately in exchange for 7-30's, and is shipping the coin East for Government account. A large shipment of eoin was made by this reticent official by the last steamer.

Yellow Jacket receded to $2,550, advanced to $2,600, and closed at $2,510 bid, $2,550 asked ; 37 feet were sold. The net yield of this claim for the month of March amounted to about $155,000, leaving a surplus of some $35,000 in the treasury of the company after the payment of a dividend of $100 per foot. In the lower level of the mine a drift has been run due east a distance of 60 feet, from the shaft to the elay wall, and at that point a body of fine black sulphuret ore, 28 feet in width, has been found, similar to, though of more value, than that met with in the 280 feet level above. Northwest of the shaft a number of galleries have been formed, through pay ore some 60 feet in width, and no limit has been fouud thus far to the ore above, at the west, south and east. In the uorthern portion of the mine, 120 feet above the ledge struck in the east drift of the lower level, the lode is said to be 28 feet wide, and perfectly developed a distance of 300 feet in length. The company are about to siuk an immense shaft outside of the ledge, from which drifts are to communicate with the different levels.

Gould & Curry advanced to $2,000 early in the week, at which rate 12 feet have since been sold. Reeent operations in the upper levels have disclosed large bodies of good ore and it is now estimated that above the lower tunuel there is still a reserve of some 40,000 tons to be taken from the old works. At a depth of eighty feet below the lowest level in the Savage a considerable body of fine ore has been found, within a few feet of the latter mine. The regular dividend of $75 per foot will be declared for the month of Mareh.

Savage has been in decided request and 79 feet were sold, mostly to capitalists of Novada, at rates steadily advancing from $1,780 to $2,010, and closing at $2,010 bid, and $2,015 asked. The average product of the miue is uow about 290 tons of ore per day. Drifts from the next level will open the mine at some 80 feet greater depth. The shaft is down some seventy feet from the present lower working level, so that little additional work remains to be done before reaching a new level. $75 per foot will be disbursed to the stockholders next week.

Belcher is also in better favor and 39 feet were dealt in, opening at $1,600, advaneing to $1,660 and closing at about $1,650. After the payment of a dividend of $75 per foot for the month of March a surplus of some $25,000 will remain at the credit of the eompany.

Crown Point declined from $1,500 to $1,435, and is now held at $1,400. Small sales have been made. An average of sixty tons of ore, worth about $60 per ton, is now daily taken from this elaim. Within thirty days the company anticipate hoisting 200 tons per day, and will also siuk deeper from the 230 feet level.

Potosi has been very largely dealt in, and 109 feet ehanged hands, advancing to $1,000 buyer 30, declining to $940, rallying to $1,035 buyer 30, and elosing at about $1,000 cash. The vein in the lower or 485 feet level has now been explored, north and south, a distanee of 550 feet, every portion of which is believed to contain pay ore. From this level to the 425 feet level above, vast deposits of good ore, it is thonght, ean yet be taken. In what is known as slope B, cross cuts and tunnels have been run promiseuously, and in the north end of this part of the mine, it is said, a virgin mass of ore exists 240 feet long and 252 feet deep.

Chollar has been tolerably well maintained this week and 224 feet were sold, advancing from $710 to $780, deelining to $675, rallying to $742, and closing yesterday at about $700. A body of oro has been met with at a point 100 feet distant and south west from the 4th level in the south mine, and other portions of this claim are thought to be more promising. The argument of eounsel is now being heard in the suit of this company *vs.* Potosi, to determine whether a new cause of aetion can be maintained. If so, a trial will take place before Judge Mesick and a jury.

Ophir is in better request and 52 feet were sold, advancing from $440 to $600, and closing at $550 bid, $555 asked. We ean learn of no new developments in the mine to eause this sudden rise. Rumors are current upon the street of rich strikes, ete., whieb we are assured are without foundatiou. Water in the Central shaft remains at about tbe level it has maintained the past three months. The work of sinking in the Mexiean shaft progresses steadily, and drifting will probably commence early in May.

Uncle Sam has been steadily maintained at from $347½ to $300, elosing at $300 bid ; 171 shares were sold. Overmau has been dealt in at $300. Hale & Norcross advanced from $335 to $410 and closes at $405 bid.

Imperial has been dealt in at $197½@$200 per share, closing at $200 asked ; 100 shares ehanging hands. The shaft in this mine is now down 520 feet—70 feet below the present level—and fine ore has been met with at this depth. After the payment of a dividend of $10 per share for the month of March a surplus of some $25,000 will remain on hand.

Burning Moscow deelined from $41 to $34, and closes at $37. Sierra Nevada rose to $19 and elosed at $17. Lady Bryan advaneed from $10¾ to $15, buyer 30, closing at $11. Golden Age & Empire rose from $10½ to $11½ per share. Baltimore Amerieau was sold at $20@$21 ; Baltic at $20@$25 ; North Amerieau at $30@$32 ; Bullion at $110, and Sheha at $29@$30. Wide West rose from $12 to $17, and declined to $13. Buckeye fell to $4 and Blue Ledge rose from $2 to $2½.

The recorded sales of Stocks and Legal Tender Notes since Saturday last have amounted to $1,191,385, and for the month of Mareh the total transactions at the Board aggregate $4,946,529.50, of which sum about $1,500,000 was in greenbaeks.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD.

Saturday, March 25.

1 sh Savage at 1780 per foot.
1 sh Savage at 1785 per foot.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

Office of the Mining and Scientific Press—Nos. 11 and 55 Government House, corner Washington and Sansome streets, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable ones, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them personally at our office, or to advise them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has not been patented, the applicant will be able to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially different from the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his own has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be an interference, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $20 to $30. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will ofttimes find it very important to take advantage of the caveat system—the expense under the law being comparatively smal

To enable us to prepare caveal paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing drawings, prosecuting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensue. If the application is rejected we cause a thorough investigation to be made into the reasons presented in the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportioned to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a let-

ter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil cloths, prints, paper hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or composition in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, all remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 y'rs and 6 mos... $10
On every application for a design, for seven years... 15
On every application for a design, for fourteen years... 30
On every caveat... 10
On every application for a patent... 15
On issuing each original patent... 20
On filing a disclaimer... 10
On every application for a re-issue... 30
On every additional patent granted on a re-issue... 30
On every application for an extension... 50
On the grant of every extension... 50
On appeal to the Commissioner from Examiners-in-chief 20
On every appeal to the Judges of Circuit Court, D. C.... 25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injine tion from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, Government House, corner Sansome and Washington streets, San Francisco.

Just and True Economy
IN MINING ADVERTISING.

The Proprietors of the Mining and Scientific Press would call the especial attention of Mining Secretaries, Trustees and Shareholders, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The Press enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the Press is less by one half than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the Press, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the Press or some other paper.

6th. Many copies of the Press are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudices, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the Press, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

Last, but not Least.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the Press shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

Mechanical.

STEAM ON COMMON ROADS.

Steam carriages for running on common roads have long been a favorite scheme with inventors. The idea is an attractive one, and there are, apparently, no insurmountable mechanical hindrances in the way of its successful accomplishment. Probably the greatest difficulty to be overcome is the necessary jolting to which such a carriage would be unavoidably exposed by the uneven nature of common roads. The evil effects of continual jarring, in any class of machinery, is well known to every mechanic. Still, as is proved by the well known service of the steam fire engine, that objection is not insurmountable. The jarring could in a great measure be removed by properly constructed and well adjusted springs, while any required degree of strength might be imparted by adding weight to the various parts of the machine. Early in the present century, even before railroad locomotives were invented, a steam carriage was built and successfully run over a common road, and up quite a steep acclivity in the town of Dedham, Mass. In almost every part of the country steam carriages have been brought out, from time to time, with more or less success in the measure of their performance. California has not yet been without an approximately successful effort in this direction.

The latest invention of this kind which we have noticed was one which was recently driven from Bridgeport, Conn., to New Haven. Several prominent individuals were passengers and witnessed its performance, which was highly spoken off. Seven dollars a day is said to be the cost of running it. Still, we have no doubt that this, like all its predecessors, will soon come to grief, and be cast aside as worthless rubbish. The chief difficulty in the way of steam carriages on common roads is really nothing more or less than their unpopularity. Every man cannot be his own engineer, or afford to keep one in his employ; and breakages must necessarily subject their owners to great trouble. A broken harness or almost any other break about an ordinary carriage, short of absolute wreck, can readily be repaired for temporary purposes of returning to stable, etc.; but when a piston or connecting rod of an engine gives out, or almost any other damage ensues, the breakdown is a helpless case. Then again, the damage to roads, and the constant annoyance of frigbt to every piece of horse-flesh which might be encountered, all tend to make them unpopular. Unpopularity and inconvenience are greater hindrances to this class of locomotion than mechanical difficulties, and are much less easily overcome. Hence, however alluring and possible the scheme may be, even a limited introduction of steam carriages on common roads must be set down as an accomplishment a long way off, if not even quite impossible.

Cloth from Milk-Weed.—We have been shown several specimens of textile fabrics woven from the seed-inclosing fibre which fills the pods of the plant well-known as milk-weed, and botanically named the *Asclepios Syriaca*. These fabrics are soft and pleasant to the touch, as would be expected, but seem also quite firm and strong, as would not be expected.—*Eastern papers.*

The new fabric, it is said, takes dyes admirably—much better than cotton—and sheds its seeds without ginning or other difficult labor. A company is formed to engage in its manufacture.

Still another textile material, the product of the mulberry tree, has recently been discovered by accident. It was observed that when the branches of the mulberry tree were split off, a long, white, silky tuft in a few weeks hung down from the wounded part, and that it was well adapted for thread when bleached by the weather. It was found by means of subsequent experiments that the mulberry tree is capable of affording a large quantity of this material, which has been named "tree-silk." It is procured of the best quality while the sap is in the tree; the product is too woody in winter, and is not suitable to the finer textile fabrics.

Death of an Inventor.—Wm. F. Ketchum, inventor of the reaping and mowing machine which bears his name, died lately at Buffalo, New York.

Thin Rolled Steel.—The competition of thin rolling steel appears to be quite actively kept up in England. It will be recollected that the Pennsylvania company, who commenced their experiments by writing a letter on a sheet rolled to a degree which required 1,000 to make an inch of thickness, were answered by an English firm on a sheet which measured 1,015 to the inch. Since that time various other English experiments have been made, until Messrs. R. Williams & Co., of West Bromwich, and the Hope Iron Co., of Tipton, have each produced sheets which require 2,000 to make an inch of thickness. The thinnest tissue paper that can be purchased at the stationers' shops measure only 1,200 to the inch. These samples of cold rolled cast-steel show very fine holes, and have a porous surface, but still are perfectly smooth and easy to write upon, the porosity being only visible when held before a good light. It is believed that steel still thinner can be rolled, and further experiments are about to be made with that object.

Interesting and Important Experiment.—At a late meeting of the Academy of Sciences, at Paris, M. Julien, formerly director of the Loriette Steel Works, annexed to those of Assailly, presented a note relative to the conversion of iron by means of graphite. He states that in the year 1858 he received from MM. Petit and Gaudet a ton of natural graphite from Germany, with an invitation to try it in place of charcoal. For this purpose he had made small iron boxes, in which he placed the bars to be converted, surrounded by graphite reduced to powder, and strongly compressed. They were then closed by a cover, and all air excluded. The boxes, placed in the midst of the furnace, gave a description of steel differing in no way from that in the other parts of the furnace. This fact is in direct opposition to the assertions of M. Caron on one hand, and M. Fremy on the other. The graphite was pure, and in most of the essays previously calcined. The rest of the ton was employed at the foundry, instead of charcoal, to be mixed with the iron for spring steel: in 7,000 or 8,000 kilos. of ingots thus manufactured there was no difference between them and ordinary steel. This is the less surprising, considering that when he made these experiments M. Krupp was said to use nothing else in his works. It is plain, then, that carbon alone enters into the conversion of iron into steel. As far as this goes, he is of the same opinion as M. Margueritte, but not so with regard to the conversion of iron by the oxyd of carbon. Already, thirty years ago, MM. Laurent and Leplay presented a theory based on this fact. He regrets to say that reasons, of too great length to be detailed here, authorize him to affirm that the oxyd of carbon (carbonic oxyd gas) does not convert iron. If, then, M. Margueritte has obtained steel, and not burnt iron, by causing a stream of carbonic oxyd gas to pass over iron heated to redness, that arises from his carbonic oxyd gas, as is the case with common street gas, containing carbon in solution. Let the carbonic oxyd gas, prepared as he indicates, be submitted to analysis, and it will be found to contain more carbon than enters into the composition of the gas.

Paraffined Wood.—Mr. Stewart Gwynne, of New York, according to the *American Artisan*, has experimented in the preparation of wood for fine work, in which quality is of more importance than cheapness and has found that paraffine is the best substance with which to saturate it. It resists moisture, acids, alkalies, and the prevalent causes of decay and change of dimensions, and is easily forced into the pores, as it fuses at a moderate heat, and does not injure other substances. He thinks it will preserve the panels which artists paint upon, so that they will not warp and split, and will be applicable for coach and joiners' work. But the work he has applied it to is engineers' work, such as the teeth of wheels, for which it appears to have all the qualities desired. He intends to patent the use of it for such purposes if further trials confirm his present views of it.

An Electrical Clock was placed upon the Custom-house and Postoffice building in this city, last week. It was placed there by Mr. Charles Hain, watchmaker, at No. 513 Montgomery street. It is moved and kept in time by telegraphic connection with the beautiful regulator clock in his store, some half a dozen blocks distant. The same principle can be applied through any distance where constant telegraph communication can be kept up. A number of clocks, in different localities, can be worked by the same battery, and all be made to keep absolutely uniform time.

Manipulation of Metals.

There are many occasions where a knowledge of some simple alloy or a peculiar solder would save hundreds, yes, thousands of dollars, just as a life may be saved by merely tying a pocket-handkerchief tightly above a bleeding artery. It is only a few years ago that the valve-stem on the engine that runs the *Herald* presses broke in the dead of night, when but half the edition was run off. This was a dilemma, indeed, for a valve-stem is not made in half an hour, neither can it be bought at a hardware store like a pound of nails. The engine was injured in a vital part, and unless it was mended the entire edition would be stopped and incalculable loss sustained. Fortunately for the proprietors, there was one of the employees present who understood the manipulation of metals, and he informed the by-standers that if they would collect their spare silver he would restore the broken part to a condition of usefulness.

It was done.

The stem was brazed with silver solder, and the engine performed until morning, so that the whole edition was successfully run off But for the presence of the adept referred to, and his knowledge of this simple process, very great loss would have been incurred.

Some of our readers may be caught in just such a predicament, and we therefore append a formula for a solder which will braze steel. It is as follows: Silver 19 parts; copper 1 part; brass 2 parts; if practicable, charcoal dust should be strewed over the melted metal in the crucible.

A good article of yellow brass is extremely desirable for fine work in telescopes and optical instruments generally. A metal that works free and soft under the tool, and is capable of receiving a fair lustre from the burnisher, is always in request. A good yellow brass can be made from the following metals: That denominated "watch-makers' brass" is made of one part copper and two parts zinc. German brass is equal parts of copper and zinc; the addition of a little lead makes the metal work easier and less liable to tear under the tool.

In all these mixtures the zinc must be added last, as it is a volatile metal and fuses at a much lower heat than the copper; the melting point of which is 4,587 degrees, while that of zinc is only 700 degrees.

Iron and brass must be united by spelter, which is equal parts of brass and zinc. When the joints are cleaned and wired together line powdered borax is applied to them as a flux. The solder is then dusted on in the form of a powder, or fine filings, and melted in either with a blow-pipe, or being placed in a charcoal fire. Care must be taken not to melt the brass to be brazed. The solder of course has a much lower fusion point than the metals to be joined, else they would both run at the same time.

A simple method of case-hardening small wrought iron work is to make a mixture of equal parts of pulverized prussiate of potash, saltpetre, and sal ammoniac. The articles must be heated to a dull red, then rolled in this powder, and afterwards plunged into a bath of four ounces of sal ammoniac and two ounces of potash dissolved in a gallon of water.

These simple rules are practical, and will give good results with good workmanship. If the wrought iron is overheated and burned, the unskillful workman must not blame the formula for his failure; or if he put on such a blast as to blow the solder out of the joints, when brazing, and instead of making a joint spoils the job, he must not charge it upon us, but keep a brighter lookout in future. Good rules are useless, unless put in force practised with skill and intelligence.—*London Mechanics' Magazine.*

At the last sitting of the Academy of Sciences, a paper was received from Dr. Blanchet, on three curious cases of constitutional lethargic slumber. One of them was that of a lady twenty-four years of age, who, having slept for forty days at the age of eighteen, and fifty days at the age of twenty, during her honeymoon, at length she had a fit of sleep which lasted nearly a whole year, from Easter Sunday, 1862, to March, 1863. During this long period a false front tooth had to be taken out, in order to introduce milk and broth into her mouth. This was her only food. She remained motionless, insensible, and all her muscles were in a state of contraction. Her pulse was low, her breathing scarcely perceptible. There were no evacuations, no leanness. Her complexion was florid and healthy. The other cases were exactly similar. Dr. Blanchet is of opinion that, in such cases, no stimulants or forced motion ought to be employed.—*English Paper.*

Mechanics' Institute Library.—The Directors of the Mechanics' Institute, of this city, sent an order by the last steamer, for an invoice of standard and miscellaneous works, the list of which will probably reach one thousand volumes, for the library of that institution.

[CIRCULAR.]

Great Improvement in Blasting.

LINSCOTT'S

PATENT CHAMBER DRILL.

Messrs. B. F. SHERWOOD and WM. H. GODFREY, having purchased the exclusive right of manufacturing the LINSCOTT PATENT CHAMBER DRILL, are now prepared to furnish the public with this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole, giving more than double the effect in blasting, besides a great saving of labor, powder, etc. The price of this drill is $35, including two sets of Cutters; $5 per set for extra Cutters. All orders promptly filled by addressing

ISAIAH WESTON,
Nos. 4 and 5 Government House,
Corner Washington and Sansome streets, San Francisco.

Drills may be seen at the office.

San Francisco, March 17, 1865.

This is to certify that I have this day sold the exclusive right and title of manufacturing the LINSCOTT PATENT CHAMBER DRILL on the Pacific Coast, embracing all the country lying west of the Rocky Mountains, to B. F. SHERWOOD and WM. H. GODFREY, as long as the patent may exist.

J. M. LINSCOTT.

DIRECTIONS FOR USING:

When your Cutters become dull, grind them on a grind-stone, so as to preserve the original temper, as they have the temper of cutlery.

STRIKE LIGHTLY UPON YOUR DRILL!

The Drills are made of the best of inch steel and the best of iron. Many attempts have been made to affect this valuable article; but all have failed to work perfect until within the last few months, when he simplified the working of the Dies to perfection:

Recommendations by Users.

Grass Valley, February 7, 1865.

I do hereby certify that we have been using the Linscott new Patent Chamber Drill for about two weeks, in the Eureka mine, and we find that it merits all that the inventor claims for it, namely: That two men, with the aid of this drill, can raise as much rock as four can without it, and with one-half the amount of powder and fuse. We have adopted its use in our mine, and recommend it to the public.

J. C. Goad,
Superintendent Eureka Mine.

Grass Valley, February, 1865.

I do hereby certify that I have seen the working of the Linscott new Patent Chamber Drill, and am well pleased with it, believing it to be a great improvement in blasting, both in saving labor, powder and fuse; and I endorse the same as being one of the great improvements of the age. William Clift,
Hunston Hill Mine.

Grass Valley, February, 1865.

I do hereby certify that I have tested the Linscott new Patent Drill in rock requiring fifty drills to penetrate to the depth of two feet, and find that this instrument chambers the same without any difficulty; and I do hereby recommend it to the public as being a great labor-saving machine. By chambering the holes with this instrument, three times the quantity of rock may be thrown than can be by the old process, and using only the same amount of powder and fuse. Sam'l F. Paul,
Foreman of Empire Mine.

Grass Valley, February 8, 1865.

I hereby certify that after thoroughly testing the Linscott new Patent Chamber Drill in all kinds of rock, and being satisfied with its merits, that we have adopted its use in the Eureka mine, and take pleasure in recommending it to the public. Having had many years' experience in mining, both in this country and England, I feel safe in saying that this drill will meet the approbation of miners everywhere. Two men, with the aid of this instrument, can raise twice the quantity of rock in any given time, than they could possibly, using only the common drill, and with less powder and fuse. M. Bennerlback,
Foreman Eureka Mill & Mining Co.

INFRINGEMENTS.

The manufacture, sale, or use of a patented article, without the consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable, either collectively or individually.

Mining and Scientific Press.

One copy, six months, in advance,..... 3 00

☞ For sale by Carriers and Newsdealers. ☜

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, April 1, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentlemen worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the Press, will be acknowledged as a personal favor to us:—

Wm. R. Bradshaw—San Joaquin, Calaveras, Merced, Tuolumne, Stanislaus and Mariposa counties.

Mr. Robert Lattimore—Butte and Yuba counties.

W. H. Laws—Placer and El Dorado counties.

Thos. Poyzer, of Grass Valley, for Nevada county.

OUR PETROLEUM INTERESTS.

Whether for good or ill, there is no question but that the petroleum interest on this coast is attracting a most marked degree of attention, which bids fair to culminate, as all such excitements are apt to do, in a kind of mania. We have repeatedly cautioned our readers and the public for running recklessly into mining excitements of any class, not that we would discourage every attempt at mining adventure short of absolute certainty, for that would be suicidal to the great leading industrial interest of the Pacific Coast; but to the end, merely, to advise our readers to carefully weigh the chances before, and previous to investing, to see that they are entrusting their money into honest hands, and placing it where it will be judiciously and economically expended. This has been quite too much a land of excitement, and the consequences thereof have been so generally unfortunate, that in the incipiency of the new and important branch of business now opening up before us, we have an earnest desire to see it first fairly proven, and then calmly and carefully developed. We do not, in the elegant language of a cotemporary, expect to "see the grease in largely and regularly arriving quantities from the interior" before "believing soundly in petroleum." The nature of the business is such that petroleum cannot be expected to arrive in quantity until refineries shall be erected on the sea board, where it may be prepared for the market. All we need wait for is the boring of a sufficient number of wells to ascertain whether internal reservoirs of the fluid can be found here as they exist in the Atlantic States. These developments are now in progress in various parts of the State, and a few weeks longer will place this question beyond a doubt.

The existence of a fine quality of petroleum on this coast, we consider is already fully proven by numerous experiments in this city. The latest and most conclusive evidence is elsewhere alluded to in our columns to-day. We have ourselves seen the crude oil at the well, witnessed the process of distillation in this city, and seen the refined article transferred directly to a lamp in the laboratory and there burned.

We have from time to time noticed the progress of discovery in this direction, until the prediction which we ventured at the outset is now pretty fully confirmed, that the crude material may be found in every county comprising both the coast and valley range, from the northern portion of Humboldt to the southern boundary of Los Angeles.

A very important discovery has been announced, during the past week, in Napa county, on lands belonging to Mr. Goodrich, a few miles from Napa City. The developments are very important, and measures have been taken for the immediate organization of a company with a capital of $600,000. The work of development will be commenced forthwith.

The developments in Humboldt county are said to be very interesting; also in Colusa, where quite a large number of locations have been made. We understand that Mr. Alexander Gamble of this city, and others have purchased a location in this county for $75,000.

Messrs. Kirk & Little have commened boring a well for the Bolinas Petroleum Company, located on the point at the entrance of Bolinas Bay, Marin county. This is a company which has recently been organized in this city. The capital has already been paid in for an energetic and efficient development of their claim. They are now down nearly sixty feet.

"The Aroyo Hondo" is the name of another company, located on the Bolinas Grant, in Marin county, about three miles from the first mentioned company, also on the sea coast. This company is made up of quite a number of San Francisco capitalists, among whom we may mention W. T. Coleman, Louis McLane, S. F. Butterworth, George T. Hearst and others. Messrs. Kirk & Little sent up boring tools on Tuesday last to commence work for that company. Work upon the well will be prosecuted with all possible dispatch.

"The San Pablo Petroleum Company" is the name of still another organization, whose works are located about one mile back of the town of San Pablo, in San Pablo Bay. Messrs. Kirk & Little will commence boring at this locality on Monday. The site selected for boring is at an elevation of about seventy feet above tide water.

We hear encouraging reports from the Adam's well. An attempt was made to pump, a few days since, but through some defect, the machinery soon gave out, and the pumping ceased, but will soon be resumed. Six gallons of oil were saved during the brief period of pumping.

THE BESSEMER PROCESS.—Some idea may be formed of the great success which has been attained by the Bessamer process for manufacturing steel from the fact that Mr. B. is at present deriving an annual income from royalties on the manufacture of steel by his pneumatic process, of at least £100,000 per annum: yet the sole cause of the patent being capable of application at all was the discovery by Mr. Robert Mushet of the fact that the admixture of spiegeleisen with iron being operated upon would result in a steel-like product. It appears that out of the profits of his patents, Mr. Bessemer has been enabled to purchase the rights of Martien, the original inventor of the process, for £30,000; yet at the time the third year's fee became payable upon Mr. Mushet's patent, the friends who were then supplying him with funds to assist him in the enormous expense he was incurring in perfecting his invention, so far failed to see the importance of the discovery that the £50 was not forthcoming, and spiegeleisen is now used both in England and on this Continent without payment of royalty to the discoverer for the advantage of using it.

MATTOLE VALLEY OIL.—Mr. Wm. Ede has furnished us a bottle of petroleum oil reported from the ground of the first location in Mattole Valley, Humboldt county, California. It is quite different from any petroleum we have seen from other sections of the State. In smell and color it appears precisely like the original "Rock Oil" of Pennsylvania, as it made its appearance in the Eastern markets as a newly discovered liniment and wonderful cure-all. The Mattole oil, in its natural condition, burns freely in kerosene lamps, and is claimed to contain ninety-five per cent. burning fluid.

Copper Smelting at Copperopolis.

M. P. Descrmeaux is the superintendent of the Copper Smelting Works established at Copperopolis last September. Notwithstanding the difficulties in starting an establishment of this kind, he sent, on the 21st inst., to Mr. Meader & Co., at Stockton, owners of the smelting establishment, some tons of pure copper, which you will see in San Francisco in a few days. The establishment is in its infancy and will be increased as circumstances may seem to require. They can now smelt 4,000 pounds of pure copper per day. I am happy to say that M. Descrmeaux is a countryman of ours, and, I believe, the first one who has attempted and succeeded in working, with profit the refuse copper ores. The ore smelted in this manner by this gentleman came from the Union mine.

We have translated the above paragraph from the *Echo du Pacifique*. We understand that the smelting company above alluded to, have erected two cupolas. The process is quite similar to that described by Dr. D'Heirry, in his late articles on the "Metallurgy of Copper in California," published in the columns of this paper. In the calcination process, which is performed in the open air, the practice at Copperopolis is to cover the heap with a coating of clay, after the manner of covering a brick kiln. A more economical plan is to reduce a small portion of the ore itself to a sand and cover the heaps with that sand, in a dry condition, carefully utilizing the process of calcination, and covering anew any openings that may occur in the process, and thus regulating the intensity of the heat. By covering with clay, just so much refuse material must be put through the furnaces without any result. With this exception the process now in actual and successful operation at Copperopolis is essentially the same as that described by Dr. D'Heirry. The amount of black copper obtained from the above mentioned works, we are inclined to think, is somewhat exaggerated, as the amount usually obtained from two furnaces, working from six to eight per cent. ore, as at Copperopolis, does not exceed 1,200 pounds in each twenty-four hours. Of course the amount will be increased with the increased average of the ore to be worked. Six to eight per cent., as we understand, can be successfully worked at Copperopolis, where the charcoal has to be transported fifteen miles. Where coal can be obtained on the ground, a much lower per centage can be worked—say from four to five per cent., and perhaps a still lower grade. Two per cent. is economically smelted in England. The last operation, that of refining, as has been described in our columns, is dispensed with at Copperopolis. Black copper, only, is produced there, of probably about ninety per cent.

A NEW HAIR RESTORATIVE. — Professor Michael Howard, of Virginia City, has invented a new hair restorative for restoring the hair to bald heads, which promises to be the most successful of anything yet compounded. We have seen a living monument of the Professor's skill on the caput of a gentleman of this city of undoubted truth and veracity, who assures us that when he commenced using the preparation the top of his head was as bald as a marble shaft. He has now a luxuriant growth of hair, cropping out all over his head. The Professor has the names of many persons, of both sexes, well known to the community, attached to his card of references, and is taking out letters patent for his preparation through this office.

MAP OF THE PACIFIC COAST.—We have received from Mr. Warren Holt, of the Mead House, on Montgomery street, a new map of all that portion of the United States lying between the Mississippi river and the Pacific ocean. It represents the latest State and Territorial organizations, and gives at a glance a full, connected and quite correct idea of the vast mineral regions of the Sierras, the Great Basin and the Rocky Mountains. One of these maps should be found in every counting room, mining office, etc., on the Pacific coast.

THERE are six negro churches in Savannah, all with fine organs and choirs.

EASTERN CAPITAL IN NEVADA AND COLORADO.

It is stated by the Colorado papers that $40,000,000, in currency, has been invested in the the purchase of claims and erection of machinery in Colorado (Pike's Peak region) during the past fifteen months. We are informed by a gentleman extensively engaged in mercantile operations at Reese River, that not less than twenty-five or thirty millions of dollars will be expended, from the same source, in the vicinity of Austin, during the coming summer. Large amounts are already coming forward. The course which San Francisco is pursuing with regard to the development of the mines in that region is most suicidal in policy. The location of the business offices of these mines in New York is having the effect to turn the merchants of Reese River eastward for supplies and machinery. A large lot of machinery is now on its way over the mountains for Austin, and arrangements are being made for the shipment of bullion direct to New York, instead of *via* San Francisco.

Reese River is undoubtedly destined to prove one of the most, if not *the* most, important mining center on the Pacific slope, and San Francisco will assuredly mistake her own interests if she fails to take vigorous measures to secure her rapidly growing trade, for which at least three of our Eastern cities are now competing. We have repeatedly laid this matter before the capitalists of this city, and as our attention has, within a few days, again been especially called to an accumulation of facts in this direction, detrimental to the interests of San Francisco, we once more raise a warning voice, and assure them that if their present supineness shall continue another twelve month, the chances will be that a large portion of the business of Reese River will be forever diverted from the Pacific Coast.

THE GENUINE ARTICLE.—Grave doubts have been expressed in certain quarters whether any such thing as a genuine article of kerosene oil can be produced from any oleaginous product of the rocks of California. Even a leading newspaper in this city has given publicity and its influence as a journal, to such an idea. The perceptions of such croakers might have been somewhat quieted, by witnessing an interesting exhibition which took place on Monday evening last, at the office of the National Petroleum Company, Government House, in this city. The exhibition took place in the presence of a quite a number of gentlemen, among whom the press was fully represented. Two bottles of oil were placed upon the table, one of which had just been distilled by Mr. E. Benoist, of 643 Third street, from a lot of crude oil, which was recently received in this city from the claims of the Buena Vista Oil Company, in Tulare county; the other with Downer's best kerosene. Two lamps were filled, one from each of these bottles, and both lighted at once. The flame of each was apparently of the same color. The lamps burned the entire evening, and it was generally remarked by those present, that if any difference existed, it was in favor of the California article. The same experiments have been repeated in Los Angeles, with equal success, and with oil obtained from the neighborhood of that city. We consider the question definitely settled, that California can produce kerosene equal to the best that can be obtained from the East. The only question now remains is the *quantity* and *cost*; a few weeks, at the farthest, will fully test those points. If the results of the present borings are successful, oil stock will go up; and unless a steady nerve is maintained by our citizens, "petroleum on the brain," of the most malignant type, will make its appearance in California.

BULLION FROM REESE RIVER.—For the week ending with Saturday last, there was received at Virginia City, from Reese River, nine hundred pounds of bullion, worth $28,610.07

A very destructive fire broke out in Oakland on Saturday afternoon last, near the railroad depot, which destroyed property to the amount of $150,000.

Mining Summary.

CALIFORNIA.

The amount of bullion now coming down from the mountains appears to be rapidly on the increase, and augurs well for the general prosperity of the miners. The officers of the Mint in this city say that the spring business opens heavier than ever before. The large receipts of gold undoubtedly result from the extraordinary facilities for placer washing afforded by the generous rains of the past season. In many districts where deep hill mining generally obtains, great quantities of auriferous earth had accumulated from drifting, which are now being washed. The severe winter in the north has checked mining operations in Oregon, Idaho and British Columbia, and the treasure receipts from these regions have fallen very low. Hence it is apparent that the heavier deposits at the Mint come from our own mines, and indicate that the season will be one of the most prosperous ever known in the State. The Marysville *Express* is informed by a person who has just returned from a tour through the mining districts in the upper portion of Yuba and Nevada counties, that he never before saw such a general mining activity as prevails throughout that portion of the country. While the heavy works are being pushed forward with great activity, he says that wherever water has been introduced, rockers and pans have been brought into service, and he believes the present mining season, which has hardly yet been opened, will be the most prosperous that has been known for many years. The "Soug of the Flume" appears to be popular music in every camp, gulch and cañon throughout the mines.

Trinity.—The Trinity *Journal* gives flattering accounts from the various sections of that county. A plentiful supply of water seems to be guaranteed until late in the season, and the miners have gone to work with a will and zeal seldom witnessed. In addition to placer workings much attention is also being paid to quartz mining at Trinity Center. Everybody is at work at Lewiston, Douglas City, Indian Creek, Junction City, Cañou City, and all the small camps, north, south, east or west. The new mining district opposite Cox's Bar also begins to attract considerable attention.

Shasta.—The Highland Mill, according to the *Courier*, cleaned up on the 18th inst., after a nine days' run. The amalgam, reduced and assayed, amounted to $5,235. The superintendent says that if the weather had admitted of his getting the best rock to the mill, of which there is an abundance, he would have doubled the above returns in the run.

The Washington Company have struck a new lode in one of the old tunnels, running at right angles with the lode heretofore worked, which is very rich in coarse gold. The superintendent took from the rock many coarse pieces, one of which is as large as an ordinary man's fore-finger from the end to the first joint.

A brick has been taken from the Kellinger lode and worked at the Kelley mill, which shows some considerable native silver. The occurrence appears to have created considerable excitement.

The Spring Creek mill having been pronounced in some way defective, Mr. Robert Stevenson, according to the *Courier*, is now in San Francisco for the purpose of purchasing more perfect machinery for saving the gold. The company have now on hand, and easy of access, a sufficiency of rock to keep the mill busy for all coming time, and when they have erected machinery that will save the free gold therein, no doubt of great results is entertained.

Nevada.—The Sneath & Clay mill is kept running night and day, crushing about sixteen tons each twenty-four hours. They cleaned up on Saturday last, after a run of five days, and took out $2,500. The proprietors also have an hydraulic claim near their vein, upon which they are also at work, with good prospects.

A new ledge has recently been opened on Rattlesnake creek, near Grass Valley, forty feet wide. It is said to be rich in silver. The gold of this locality has always contained a large proportion of silver, and quite a silver excitement was got up with regard to the locality, some three or four years since.

The Union and Howard Hills still continue to multiply evidences of their mineral value. The energy and earnestness with which operations have been carried on in that locality during the past few months, have met with most gratifying returns. The success of the Lucky Company is now too well known to need comment. George D. Roberts & Co., we understand, have leased the Laton mill, having fully proven the richness of the old Union ledge, in depth. Their mines will be energetically worked the coming Summer. The recent operations of the Coe Company exceed anticipations. According to the *National* of the 20th ult., fifty tons worked the previous week averaged $40 to the ton. Timber is found in great abundance upon the hill, and the veins are most admirably located for working.

Sierra.—A gentleman from Sierra county informed the Marysville *Appeal*, a few days since, that the miners of Sierra county are doing better than they have done for years past, and as an evidence, he says $40,000 of treasure came down on the last stage.

Important developments, according to the *Messenger*, are being made at Goodyear's Bar. The gold appears to be found in the greatest abundance about seven feet above the bed-rock, and the gravel now being taken out is the richest ever found on the bar. Three months ago there was but one string of sluices at work there; now there are seven, and more would be employed if water could be procured. One of the parties, Henry Thompson, who has just got down to the pay streak, says he would not exchange a foot of ground on Goodyear's Bar for one of Gould & Curry.

The Union Co., at Sawpit Flat, Plumas Co., has a very large pile out; so also has the Franklin Co. Quite a number of other companies in that vicinity are also doing well. The snows have somewhat retarded work there during the Winter, but they have also given earnest of an abundant supply of water for the coming Summer. The hydraulic wheel in use there is a great favorite. It is said to have accomplished more in ten months, in the Monitor claim, than ten years' constant toil in one or two other claims, worked after the ordinary manner.

ESMERALDA.

In the Great Western tunnel, according to the Esmeralda *Union* of the 15th inst., the workmen recently struck a lead, into which they had driven about fifteen feet, without reaching the opposite wall. The rock looks promising.

The leads of the Del Monte are said to contain a large amount of ore, sufficient of which is now in sight to keep the mill running for months. Arrangements will soon be made to start up the mill, and also to resume operations in the mine.

The new district of Columbus is still attracting a large share of attention. Assays of rock from that region give large returns.

REESE RIVER.

The *Reveille* thinks that an unmistakable evidence of the substantial basis on which hopes of coming prosperity and the ultimate and speedy development of that region, may be found in the confidence which capitalists evince by investing largely in Reese River mines. The coming Summer will more than double their present facilities for working ores, and a consequent reduction in cost will open a still broader field for enterprise and labor by bringing into the market and making profitable claims heretofore considered valueless.

The North Star has yielded, up to the present time, over $20,000 in rock ranging in value from $20 to $1,500 per ton. The second-class ore yields a profit of about $20 per ton, and the first-class from $200 to $300. This is the return after paying the expenses of working. Some of their ore is much finer, being worth from $1,400 to $1,500 per ton, but no large quantities of this class are taken out. The incline is now down to a depth of about 240 feet, and is being extended. From the reduced prices of working the ores, the quantity and quality of rock now taken out, and the addition of machinery, the superintendent anticipates that the present year will be a profitable one for the North Star.

WASHOE.

All the mills in and about Virginia City and Gold Hill are busily pounding away upon rock from old or new ledges, and generally with favorable results. Some of the ledges lately discovered prospect remarkably well by the working process.

On Saturday, the 18th instant, the Challenge Company, on Gold Hill, struck what is claimed to be a very rich ledge, twenty feet in width. The *News* describes it as fairly glittering with black sulphurets of silver and free gold and silver. The Challenge is under good management, and is taking a first rank in the list of our paying mines. The Imperial Company have commenced a drift at the lower level of this mine to open their ground. The drift has already been pushed about sixty feet, and some excellent ore is being taken out, and a large amount will soon be hoisted for the company through the Challenge Company's shaft.

About 375 tons of ore are being shipped daily out of the Yellow Jacket claim, supplying fourteen mills and at least 400 men with work.

The Minerva Company are preparing to set to work in earnest on their claim. An engine house is now being built, and powerful machinery will soon be erected.

According to the *Enterprise*, a new and very promising lead has just been discovered about a mile and a half north of the Utah claim. The lead is some ten feet in width on the surface. The new mine is called the Ben. Butler. Men are now at work running an open cut on the ground, preparatory to sinking a shaft. The owners are sanguine that they have found a very good thing.

Messrs. Carpenter & Birdsall have commenced the foundations of a very large mill, of forty-stamp capacity. It will be driven by two fifty-feet water wheels, taking water from Rose's ditch. It will be in operation in July next.

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Assessments and Delinquent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment; Date of Meeting, Delinquent Advertisement and Sale, and the Place of Business of the Corporation if it is not in San Francisco.

REVISED EVERY ISSUE.

Advertised in the Mining and Scientific Press AND OTHER SAN FRANCISCO JOURNALS*.

The Toledo tunnel, which is piercing Silver Hill from the west side, is being pushed ahead with encouraging rapidity. It has already been run in a distance of 480 feet. A short distance further on, it will tap a regular nest of rich ledges, that are known to run through that portion of the hill.

On Drops.

Mr. Guthrie Professor of Chemistry and Physics at the Royal College, Mauritius, has made to the Royal Society an elaborate communication on Drops, from which we extract the "laws" which he deduced from his observation:—

Law 1.—The drop size depends upon the rate of dropping. Generally the quicker the succession of the drops, the greater is the drop; the slower the rate, the more strictly is this the case. This law depends upon the difference, at different rates, of the thickness of the film from which the drop falls.

Law 2.—The drop size depends upon the nature and quantity of the solid which the dropping liquid holds in solution. If the liquid stands in no chemical relation to the solid, in general, the drop size diminishes as the quantity of solid contained in the liquid increases. The cause of this seems to be that the stubborn cohesion of the liquid is diminished by the solid in solution. When one or more combinations between the liquid and solid are possible, the drop size depends upon indeterminate data.

For example: certain variations in the drop size of solutions of chloride of calcium of different strengths point to the existence of definite hydrates; while the regularity of the variation of drop size in the case of nitrate of potash points to the absence of hydrates.

Law 3.—The drop size depends upon the chemical nature of the dropping liquid, and little or nothing upon its density. Of all liquids examined, water has the greatest, and acetic acid the least drop size. It is remarkable that butyric acid, which has sensibly the same specific gravity as water, rise to a drop less than half the size of the water drop.

Law 4.—The drop size depends upon the geometric relation between the solid and the liquid. If the solid be spherical, the largest drops fall from the largest spheres. Absolute difference in radii takes greater effect upon drops formed from smaller, than upon those formed from larger spheres. Of horizontal planes, within certain limits, the size of the drop varies directly with the size of the plane.

The fact that the drop increases in size according as the radius of the sphere increases from which the drop falls, and that the difference from this cause may amount to half the largest drop size, the author regards as important to dispensers of medicine. The lip of a bottle from which a drop falls is usually annuloid. The amount of solid in contact with the dropping liquid is determined by the size of two diameters, one measuring the width of the rim of the neck, the other the thickness of that rim. In most cases the curvature and massing of the solid at the point whence the liquid drops is so irregular as not to admit of any mathematical expression.

Law 5.—The drop size depends upon the chemical nature of the solid from which the drop falls, and little or nothing upon its density. Of all the solids examined natimony delivers the smallest, and tin the largest drops.

Law 6—The drop-size depends upon temperature generally the higher the temperature the smaller the drop. With water the effect of a change of temperature of 20° C. to 30° C. is very small.

Law 7.—The nature or tension of the gaseous medium has little or no effect upon drop-size.

"The First National Petroleum" is the corporate name of a company organized in this city, the past week, for the purpose of mining a certain claim of six hundred and forty acres of land, known as the Brady Claim, situated in Buena Vista county, in this State. The capitul stock of the Company is $1,000-000, which is divided into two hundred thousand shares of five dollars each. The Trustees for the first three months are M. C. Conroy, W. B. Ewer, A. W. Stratton, J. E. Vinton, and W. H. Tobey.

Reese River Manufacturers.—A branch of manufacture, says the Reese River *Reveille*, has sprung up in that section that promises to be of profit to its enterprising founders. We refer to a pottery manufactory at Washington, where all kinds of jars, pots, crocks, or whatever, as domestic articles of use, they may be called, are made in first class style. A. Mau, now occupying the old Capitol saloon, has the articles for sale. There are many other branches of industry in the manufacturing line that we hope to chronicle as having been commenced in the great country of Reese River.

The Empire Mining Company, of New York, has purchased Forgus quartz mill, in Aurora. It will be removed to Bodie District immediately, where it will be constantly employed in crushing rock from the mines of the company.

Lost in the Woods.—Mrs. E. Warren, of the Yuba County House, Yuba County, in attempting to go to the house of a neighbor about half a mile distant, a few days since, lost her way in a piece of wood, where she remained two days and nights, exposed to the rain and cold. At last she found her way to the house of a Mr. Mooro, about four miles from her home. In the meantime, at least one hundred men were in search of the woman.

The Mining and Scientific Press is a large sixteen page (sixty-four column) weekly newspaper, especially devoted to mining progress, metallurgy, and kindred things. It is a most valuable reading journal, which has no superior on these subjects in America. It is worth, each week, a year's subscription to every miner, mill superintendent and prospector in this Territory, as it will tell them from time to time what years experience in mining cannot make them understand. Address Dewey & Co., Publishers, San Francisco. Subscriptions received, receipts given, and clubs and single names may be forwarded (by the publishers' request,) at our office and at those of the Register and the Journal, in the mountains, where sample copies can be seen from week to week.—[Rocky Mountain (Colorado) News.

In England some of the churches have pews for deaf people. They are connected with the pulpit by means of tubes, which open in the pew, with trumpet shaped mouths in convenient position for the ear of the listener.

Bullion from Reese River.—On Sunday last, Wells, Fargo & Co., shipped for this city, from their Virginia office, thirty bars of bullion, worth, according to assay, $51,148.35, and weighing 1,905 pounds.

NOTICE.

The undersigned having purchased the EXCLUSIVE RIGHT in and for the State of California, for the

Manufacture and Sale of

WINHAM'S

PATENT HOSE COUPLING,

Hereby caution all parties against the manufacture or purchase of the above Hose Couplings, except through us, as any infringement will be prosecuted to the full extent of the law.

ALL KINDS OF BRASS AND IRON WORK

Adapted to every department of Mining and Mechanics.

N. B.—The manufacture of QUARTZ MILLS are made a specialty, and all work done at the above Works guaranteed of the best material and workmanship.

☞ DON'T MISTAKE THE PLACE.
13v12 No. 9 First street, San Francisco.

IN THE DISTRICT COURT OF THE FIFTEENTH JUDICIAL District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk,
By G. C. Lurchea, Deputy Clerk.
C. Sims, Attorney for Plaintiff. 7v10-3m

REMOVAL.

The Office of the

Rose Gold Mining Company

Has been removed to No. 338 Montgomery street, Athenæum Building (Room No. 12), southeast corner Montgomery and California streets. [9v10-4t] C. M. PECK, Secretary.

GEO. B. HITCHCOCK & CO.,
Counting-House Stationers,

HAVE ALWAYS IN STORE A WELL-SELECTED STOCK OF

American and Foreign Stationery,

Blank Books of all kinds, manufactured to any desired pattern, and at the shortest notice. Mining Companies supplied in the best manner, and at reasonable rates.

GEO. B. HITCHCOCK & CO.,
2-1m 413 and 415 Sansome St., cor. Commercial, S. F.

PALMER, KNOX & CO.,
Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,

SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS,

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR.

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Taylor's Improved Water Wheel,

Giving the greatest power, at lower cost, than any Wheel in use. There are over 1,500 running, giving Universal satisfaction.

KNOX'S AMALGAMATORS,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either Gold or Silver Ores.

Genuine White Iron Stamp Shoes and Dies.

Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10-y-tf

D. S. CUTTER. W. H. TOBEY.

PETROLEUM
ASPHALTUM and COAL
AGENCY.

WM. H. TOBEY & CO.,

San Francisco,

Having completed their arrangements with parties in the East, as well as those on this Coast, are now prepared to enter into the purchase, sale or lease of

PETROLEUM, ASPHALTUM AND COAL LANDS,

—ALSO—

COPPER, GOLD AND SILVER MINES,

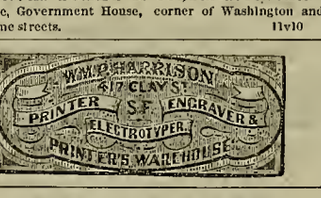
LIBERAL advancements made on CRUDE PETROLEUM and COPPER ORES. We are also prepared to supply all BORING APPARATUS, TUBING, STEAM ENGINES, BARRELS for shipping Oil, etc., of the latest and most approved patterns.

Experienced Artesian Well Borers and help furnished at the shortest notice.

Persons at a distance wishing to send orders, receive information or subscribe for stock, will save time and money by communicating with us, as we are in constant communication with the most reliable houses and experienced persons at the East.

Parties owning Oil Lands or knowing where there are good prospects, will do well to write or meet us at our office. All communications strictly confidential.

We have now on our Books descriptions of Oil Lands which were selected by experienced chemists. Companies will be organized and incorporated under the laws of the State of California.



Samples from all PETROLEUM and COAL MINES on the Pacific Coast are solicited for our Laboratory.

Best of references given.

☞ *All business connected with Petroleum and Coal Mines* will be promptly attended to. Address

W. H. TOBEY & CO., Box 2021 Post Office.

Office, Government House, corner of Washington and Sansome streets. 11v10

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

The Golden Era is furnished to Clubs at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty-five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

The Golden Era is now enlarged by the addition of eight columns to its pages—and presents fifty six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day are published as Serials, from week to week, in The Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the Golden Era are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

Serial Romances in the Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic periodicals.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by Pierce Egan, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "The Fair Lilias; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

"OUR MUTUAL FRIEND,"..... ...by Charles Dickens.

TO ADVERTISERS!

Best Advertising Medium—The "Golden Era" is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

is universally read in every city, town, village, and mining and agricultural precinct in California, and offers unusual and unequaled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

BROOKS & LAWRENCE,

Golden Era Building,

543 Clay st., near Montgomery, San Francisco.

ANCIENT AND MODERN HEROES.—The present American war furnishes materials for a greater epic than Iliad, if we only had a Homer to wed them to immortal verse. Greek and Trojan champions were mere carpet knights as compared with the men who charge right up to the muzzles of eleven-inch guns and march through enfilading fires of grape and canister without faltering. If one of their officers should flee panic stricken from the strife as Hector, Achilles, Diomed, Troilus, and a dozen more of Homer's heroes did repeatedly at the siege of Troy, he would be condemned to have his epaulettes torn off, his sword broken, and to be drummed out of camp to the tune of the "Rogue's March." The absolute contempt of death displayed by the troops on both sides in this most sanguinary of all wars, has no parallel in the past.

PLUMBAGO.—The Dayton *Sentinel* says that "a few days ago, while out hunting for stray horses, M. V. D. Flint discovered a mountain of plumbago on the north side of El Dorado Cañon, about ten miles from that place. He brought specimens to town with him, which looked well, and made as nice a mark on paper as any pencil in the market. Mr. Flint says there is a mountain which appears to be made up entirely of such material as the samples he exhibited, and an almost inexhaustible quantity is exposed to view."

BY breathing on glass, and subjecting the moisture to microscopic examination, the condition of the lungs is now definitely ascertained by a number of experimenting professors in England.

THE late flood is said to have destroyed property to the amount of two millions of dollars in Western Pennsylvania.

BLASTING

POWDER.

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties, on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

TO OWNERS OF MINES.
As many mines are being offered in the New York market, and as experience has proved that not one in ten of the titles are in proper form, we will state that the following is considered a good title:—
1. Copy of Notice of Location certified to by Recorder of District.
2. Certificate of Notary that A. B. is Recorder of District.
3. Deed of Power of Attorney from Locators to party selling, which deed or power of attorney must be recorded in the county in which the property is located.
4. Certificate from County Clerk that Notary and County Recorder is duly qualified.
C. A. CRANE,
9v10-1m No. 4 Cedar street, New York.

CHURCH-BELLS.—There is something beautiful in the church-bells—beautiful and hopeful; they talk to high and low, rich and poor, in the same voice; there is a sound in them that should scare pride and envy and meanness of all sorts from the heart of man; that should make the earth seem to him, at least for a time, a holy place. There is a preacher in every belfry, that cries, "Poor, weary, struggling, fighting creatures—poor human things! take rest; be quiet. Forget your vanities, your follies, your week-day craft, your heart-burnings! And you, ye human vessels, gilt and painted, believe the iron tongue that tells ye ye are of the same Adam's earth with the beggar at your gates. Come away, come!" cries the church-bell, "and learn to be humble—learning that, however daubed and stained, stuck about with jewels, you are but grave-clay. Come, Dives, and be taught that all your glory, as you wear it, is not half so beautiful in the eye of Heaven as the sores of the unconplaining Lazarus! And ye, poor creatures, livid and faint—stinted and crushed by the pride and hardness of the world—come, come," cries the bell, with the voice of an angel, "come and learn what is laid up for ye; and, learning, take heart, and walk among the wickednesses, the cruelties of the world, calmly as Daniel walked among the lions."

THE statue of Hercules, found at Rome, does not progress very rapidly towards its restoration. It is at present reclining on a green table in a large room, where the process of drying it goes on, the metal being saturated with damp in consequence of having been so many ages in the water. A pan of charcoal is inserted into the hero's head every morning, and communicates a genial warmth through his whole bronze body.

A SWISS engineer has succeeded in applying the galvanic battery to the sharpening of needles and pins, by connecting a bundle of wires with the negative pole in a most ingenious manner. The process is said to be cheaper than the present method, which is also very injurious to the health of the work people, in consequence of the fine metallic dust.

A LADY skater in Philadelphia, recently, fell upon the ice, with her hands extended to break the fall, just as a swift skater was gliding past. He could not check his speed, and one of his sharp skates cut off three of her fingers.

A NEW process for working gold and silver ores has been patented by the "United States Disintegratiug Ore Company" of New York. By this process ore works 95 per cent. of its assay, and the cost of apparatus is two-thirds less than that of the machinery now in vogue.

SOME poet says the wind kisses the waves. That we suppose, is the celebrated "kiss for a blow," of which we have heard so much.—*Taunton Gazette.*

SMELT have reappeared in the waters of Oregon, after an absence of eight years. They are caught in immense numbers at the mouth of Cowlitz river.

Machinery.

WM. BRUCKNER'S
Furnace for Roasting Ores,

Now in Operation at 416 Market street,

This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an Iron Cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,
6v10 No. 416 Market Street, San Francisco.

IMPORTANT INVENTION.
Hunter's Concentrator, Amalgamator and Separator.

For the concentration of Gold, Silver and Copper ores, and separating all kinds of metals from the sands, where the specific gravity of the metal is greater than that of the rock, a machine is now on exhibition at No. 521 Market st., above First, at BACON & WEBSTERS'S Quartz Grinding Works, where it will be running from two to three o'clock P. M., for the inspection of all interested in mining. The inventor is prepared to manufacture machines to supply all orders promptly. The sixth of a horse power is sufficient to run one of these machines. For the above machine a patent has been applied for. Orders for machines, or for circulars and further information, should be addressed to

ANDREW HUNTER, Inventor.

The following extracts from Reports are submitted to the public as giving the results of a fair working test of these machines:

BEAR VALLEY, DEC. 12, 1864.

MR. A. HUNTER—*Dear Sir:* I take pleasure in stating, in reply to your request, that your concentrator has now been running uninterruptedly, at Princeton Mill, for more than three weeks, and the enclosed notes, by the Superintendent Mr. Williams, of a carefully measured test of its performance during a period of a day and three-quarters, I believe fairly indicates what it has been doing through the whole of that time. First, the loss of the sulphurets, per cubic foot of tailings from the Concentrator, was about one-tenth of an ounce. Second, the loss of sulphurets from the blankets was nearly *fifteen times greater* than that from the Concentrator. The Concentrator has not been found at any time in the slightest manner out of order, and has required scarcely any attention. Congratulating you upon the these facts, I am, sir, very respectfully yours. FRED. LAW OBSTKAN,
Manager Mariposa Company.

Notes of test run of Hunter's Concentrator—it having been supplied during the test with the sands reduced by one battery of the Princton Mill, in the condition in which they are usually received by the blankets:—

Running time	1¾ days.
Amalgam saved on the plates of the Separator during above time, value	$6 75
Rate of saving of single machine per day	3 86
Rate of saving of six machines per day	23 16
Yield of Sulphurets, 1¾ days, pounds	215
Yield of Sulphurets, one day run of one machine	123
Rate per day of saving from six machines, being the whole number required for the Princeton Mill	738
Yield of amalgam from plates of Separator, per ton of rock crushed, value	55
Yield of sulphurets from Separator per ton of rock crushed, pounds	18

HANNIBAL WILLIAMS,
Superintendent Princeton Mill.

SAN FRANCISCO, DEC. 18, 1864.

I have recently examined one of Hunter's Concentrators and Amalgamators, in operation at the Princeton Mill, Mariposa Estate, the sand and crushed rock, flowing from one battery of four stamps, passing directly over the machine, without using blankets. On examination, it shows conclusively that the loss of sulphurets by the machine is much less than by the blankets, being but a mere fraction of the sulphurets, consisting of the light and thin scales, such as can scarcely be saved by panning; while on the other hand the tailings from the blankets contain a large amount of heavy sulphurets. The product of the machine is almost pure, clean sulphurets—the copper plates of the machine, being amalgamated, securing much or all of the free gold that escapes the battery. I witnessed the cleaning up of the machine, and the collection of a ball of amalgam. From the weights taken we may state the constitution of this ore, as it came from the batteries at that time, as follows:

Clean Sulphurets containing free gold and amalgam	18.00
Quartz sand, waste	1981.78
Loss of Sulphurets and tailings	.22
Total	2000.00

PAINTING.—It is painful to think how soon the paintings of Raphael, Titian, Corregio, and other illustrious men, will perish and pass away. "How long," said Napoleou to David, "will a picture last?" "About four or five hundred years." A fine immortality! The poet multiplies his works by a cheap material; and Homer and Virgil and Dante and Tasso and Molière and Milton and Shakespeare may bid oblivion defiance. The sculptor impresses his conception on metal or on marble, and expects to survive the wreck of nations and the wrongs of time; but the painter commits to perishable cloth or wood the visions of the fancy, and dies in the assurance that the life of his works will be but short in the land they adorn.

AN American tourist, while visiting Naples, saw Vesuvius during an eruption. "Have you anything like that in the New World?" was the question of an Italian spectator. "No," replied the other, "but we have a Niagara that would put it out in five minutes."

DON'T WORK WELL.—The New York *Printer* says: "After a contest of three weeks with the newspaper proprietors, on the question of wages, the St. Louis Typographical Society passed a resolution which in effect allows its members to work anywhere and at what price they please."

STONE CUTTERS.—At a recent meeting of the journeymen stone cutters of Sacramento it was determined to stand by their established rules, and demand wages at the rate of five dollars per day.

A RIVAL TO CENTRAL PARK.—The Philadelphians are going to have a new City Park, as an offset to the Central Park of New York, if there is not too much opposition in the councils.

AN eminent painter was once asked what he mixed his colors with, in order to produce so extraordinary an effect. "I mix them with *brains*, sir!" was the answer.

A SCHOOL for the instruction in the science of telegraphing has been established in San Francisco.

Machinery.

EUREKA

IMPROVED SELF-ADJUSTING

CLOTHES WRINGER,

AWARDED THE FIRST PREMIUM

At Oregon State Fair in 1864.

Abstract from Examining Committee's Report of the San Francisco Mechanics' Institute Industrial Exhibition of 1864:—

"CLOTHES WRINGERS.—A variety of these excellent Household Helps were found competing for popular favor.—Though none of them are entitled to a Premium, we consider the EUREKA, exhibited by M. E. Traver & Bro., worthy of honorable mention." [*Note*—No Premiums were awarded to articles of Eastern manufacture.]

The EUREKA CLOTHES WRINGERS are made superior to all others by the use of

PATENT ELLIPTICAL STEEL SPRINGS,

Which produce a UNIFORM PRESSURE upon garments of every size.

The IMPROVED EUREKA has the HINGE CLAMP, which will fit any tub or box perfectly. Its entire construction is simple and excellent. Every family should have one. It will soon RE-PAY ITS EXPENSE in saving time, labor, and clothes.

M. E. TRAVER & BRO.,
General Agents, San Francisco.

FARRAND'S
Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair
OF THE
Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN, O. GORI, W. T. GARRATT, GEO. JOHNSON, H. P. WAKELEE, C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,
R. L. OGDEN, Agent, SAN FRANCISCO.
S. E. corner Montgomery and California streets.
19v9

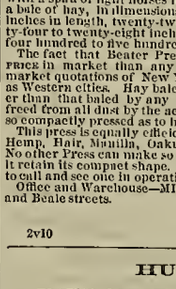
Pacific
BEATER PRESS
Company.

SAN FRANCISCO, CALIFORNIA.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other

HAY AND COTTON PRESSES.

This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay, in dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.



The fact that Beater Pressed hay commands a BETTER PRICE in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.

This press is equally efficient for Cotton, Wool, Pulu, Tow, Hemp, Hair, Manilla, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties interested are invited to call and see one in operation.

Office and Warehouse—MISSION STREET, between Main and Beale streets.

W. H. MITCHELL,
General Agent.
2v10

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.
ALSO, THE
Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,
No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S
Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $600 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HUNT'S NEW DITCHER.

HAVING SECURED FROM THE INVENTOR THE SOLE right to manufacture these Machines for the states of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to

E. O. HUNT,
Windmill Builder, No. 28 Second Street and 110 & 112 Jessie Street, San Francisco. 9v22tf

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

1 Golden State Iron Works, San Francisco.

Hansbrow's
MINING PUMP.

Six-Inch Cylinder—Eighteen-Inch Stroke—Four-Inch Suction—Three-Inch Discharge—Capable of Forcing Two Hundred Feet high with ease: Also—

HANSBROW'S FIVE-INCH DOUBLE CYLINDER,

A Powerful Hand Pump, throwing a two and a half inch stream; Also—

Hansbrow's Deep Well and Windmill Pump.

All Sizes for sale by

LOCKE & MONTAGUE,
Nos. 112 & 114 Battery Street. 2v10

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purpose intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine	No.	Fine
Assay.....250	943	Assay 300	990
Assay.....285	941	Assay for Cazman	980
Assay.....286	940	Assay Water Rock	966
Assay.....291	950	Assay Water Rock	998
Assay.....		.....St. Helena Ledge, W. D.	966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,
To whom all orders should be addressed. 15

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not once has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apertures and between the grinding surfaces. Thence it is thrown to the peripheries into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**
1v10 San Francisco.

THE NOVELTY.

This ROTARY CYLINDER GRINDER & AMALGAMATOR *did not receive* the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was passed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up, and, in fact, is a perfect machine.

In offering his Amalgamator to the mining public the Inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker on mining machinery, that there was room for improvement in that direction, and that he has, by careful study, invented his improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.

This invention consists of a cylindrical-shaped case placed horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller (one or more) placed within it, and covered with shoes one and a half inches thick, and so constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the German Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pulp in one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.

H. L. HOPKINS,
1v10 Inventor and Patentee.

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in Prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street.
15-1m

PRATER'S
PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance: Its small cost: Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 1864.] HEPBURN & PETERSON.

NOTICE TO MINERS.
NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, enpelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY, Engineer,**

FOR SALE BY

S. F. BUTTERWORTH,

Northwest cor. Battery and California sts.

v9-19 SAN FRANCISCO.

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address **J. MOSHEIMER,**

TO CAPITALISTS.

A Rare Chance for Profitable Investment.

The writer is in possession of a COPPER CLAIM, of 1,500 feet, located in Rough & Ready District, Tuolumne county, on which a shaft has been sunk to the depth of sixty feet, which is well timbered, curbed and covered, with everything necessary to the immediate prosecution of work. Also, a DWELLING HOUSE. The lode is regular and well defined, a great part of the ore from which would be classed as second quality, or No. 2. Both THOMAS and J. HARDY own in it, and could be consulted as to its merits before visiting by any parties desiring to do so. I wish either to sell or get it worked on shares, and will offer superior inducements to any one desiring to invest. Apply at

MINING AND SCIENTIFIC PRESS OFFICE,

11v10 San Francisco.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Information Wanted.—A letter mailed at Nevada City, Cal., about January 28, 1865, signed by Jas. R. English, and addressed to this office, has failed to reach us, and we hereby offer a suitable reward for any information which may be given us of its whereabouts.

8v10 **DEWEY & CO.**

SPAIN, some three centuries ago, on account of her commerce, was the mistress of the seas; but want of attention to business education soon ruined her. Aspiring youths of America, learn a lesson from her, and take a course of instruction at the Pacific National Business College, conducted on the London Corn Exchange principles.

WM. HOLLIS, Secretary.

Office, No. 302 Montgomery street, San Francisco, Cal. mar25

A VALUABLE NEWSPAPER.—The "Mining and Scientific Press," published by Dewey & Co., in San Francisco, is a useful and instructive journal for the miner and mechanic offering a vast fund of information respecting the working of metallic ores, the improvements in mining and other machinery, etc., etc. The PRESS deserves a liberal support from miners and artizans. Terms—$5 per annum, or $3 for six months.—*Placer Herald.*

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

Green Monster Copper, Gold and Silver Mining Company, Inyo Mining District, Tulare county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 21st day of March, 1865, an assessment of one ($1) dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 535 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 22d day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 6th day of May, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

I. N. THORNE, Secretary.

Office, No. 535 Clay street, San Francisco. mar26

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 11th day of March, 1865, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, or to L. A. HAWKINS, Superintendent, at Silver Mountain.

Any Stock upon which said Assessment shall remain unpaid on Saturday, the 8th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 22d day of April, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

Office, Room 5, third floor, No 439 Montgomery street, San Francisco.

Notice is hereby given that at a meeting of the Board of Trustees of the above Company, held on the 11th day of March, 1865, Assessments Nos. 3 and 4, levied December 12th, 1864, were rescinded, and stockholders having paid said assessments will be credited accordingly.

mar18 J. WARREN CLARK, Secretary.

Good Hope Gold and Silver Mining Company, Alpine District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 6th day of March, 1865, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable on or before the 1st day of April, 1865, in United States gold and silver coin, to the Secretary, or to H. MORRIS, at Markleeville. [*Delinquents will be held for accruing costs after the 1st day of April.*]

Any stock upon which said Assessment shall remain unpaid on Saturday, the 8th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 22d day of April, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

PRESTON MORRIS, Secretary.

Office, No. 626 Montgomery street, San Francisco. [mar11

Harmon Gold and Silver Mining Company, Placerville, El Dorado county, California.

T. J JONES, Secretary.

Office, 728 Montgomery street, San Francisco. mar18

THE MINING AND SCIENTIFIC PRESS.—We call the attention of our readers to an article from this valuable journal, explaining some of the reasons why it should be supported. We have no hesitation in saying it is one of the most deserving publications on the coast, in fact, the only legitimate mining journal in California. Every practical pick and shovel miner, as well as every man who may be anywise interested in mining, should have the *Press* for his own information, aside from its scientific value. Its editors and contributors are men of practical experience and qualified to speak that which they know.—*Grass Valley Union.*

"A WORD TO THE WISE," ETC.—Parties in the Eastern States who desire positive information concerning the mineral wealth and developments of the Pacific States, should look for the same in some journal, published on this coast sufficiently truthful to enjoy a permanent circulation in the communities represented. Those credulous enough to patronize the mushroom huntings of defunct California Jeremy Diddlers may expect to get "hilked."

Jewett Gold and Silver Mining Company

Works located at Gold Hill, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 8th day of March, 1865, an assessment of one dollar per share was levied upon the assessable capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 309 Clay street, in the city and county of San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 8th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall have been made before, will be sold on Saturday, the 22d day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. M. COMSTOCK, Secretary

CAUTION.

San Rafael Mining Company, Ranchita, Lower California.

The following Certificate of Shares in the capital stock of the above named Company were sold at auction, February 15th, 1865, to pay delinquent assessment levied December 21st, 1864, together with costs of advertisement and expenses of sale:—

In name of	No. Certificate.	No. Shares.
Francis Elmer.....	8	100

Parties are cautioned against purchasing the above described Certificate of Stock.

E. A. HAWLEY, Secretary.

mar4 No. 229 California street, San Francisco.

The "Mining and Scientific Press" is an excellent journal, and ought to be subscribed for by every miner and artisan on the Pacific coast.—*Nevada Daily Gazette.*

San Rafael Mining Company, Ranchita, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 9th day of March, 1865, an assessment of one dollar per share was levied upon the capital stock of said company, payable on the 11th day of March, 1865, in United States gold and silver coin, to the Secretary, E. A. Hawley.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 6th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 22d day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

E. A. HAWLEY, Secretary.

Office, No. 229 California street, San Francisco. mar11

United States Mining Company, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 13th day of March, 1865, an assessment of one dollar ($1) per share was levied upon the capital stock of said company, payable immediately in United States gold coin to the Secretary at his office, Nos. 8 & 10 Government House, corner of Sansome and Washington streets, San Francisco, California, or to James V. Coffey, No. 10 Taylor's Building, corner of C and Taylor streets, Virginia City, Nevada.

Any stock upon which said assessment shall remain unpaid on the 15th day of April, A. D., 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, April 29th, 1865, at 12 o'clock, M., to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

11v10 J. M. BUFFINGTON, Secretary.

Wide West Gold and Silver Mining Company, Silver Mountain District, Alpine county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 18th day of March, 1865, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to H. D. Scott, Superintendent, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on Saturday, the 22d day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 6th day of May, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. S. BROWN, Secretary.
J. Warren Clark, Dept. Secretary.

Office, Room 5, third floor, No. 430 Montgomery street, San Francisco, California. mar25

Wilson Copper Mining Company, Garden Bar District, Placer County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 11th day of March, 1865, an assessment of $1 per share was levied upon the capital stock of said Company, payable on the 13th day of March, 1865, in United States gold coin, to the Secretary, at the Company's office, No. 611 Clay street, Room 8, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 15th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 1st day of May, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

11v10 W. L. KIRBY, Secretary.

Webster Gold and Silver Mining Company, Location, Montgomery District, Mono county, Cal:

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 16th day of February, 1865, the several amounts set opposite the names of the respective shareholders as follows:

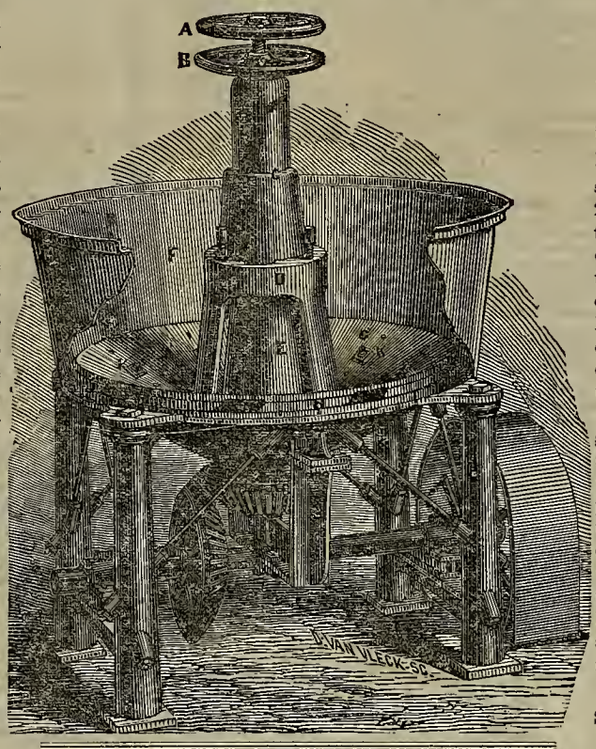
MINING BLANKS

For Sale

AT THE

OFFICE OF THE MINING AND SCIENTIFIC PRESS,

Nos. 11 & 56 Government House.



Blanks for Mining Companies, Secretaries, Shareholders and others, always on hand, or printed to order, at our office.

HEPBURN & PETERSON'S AMALGAMATOR.

Manufactured at the Principal Foundries in San Francisco.

We invite the mining public to an examination of the working capacity of our machines, as well as to our late improvements.

For the past year we have had over two hundred of our Pans in operation in the State of Nevada, and many in California and Mexico. And we find upon careful inquiry that at the majority of the mills where they are used, that the pans are charged with about 1,400 pounds of pulverized ore, and that they consume from three to four hours in completing the reduction and amalgamation of each charge, the time varying in accordance with the character and preparation of the ore. Thus each machine works from 4 2-10 to 5 6-10 tons per day, and gives general satisfaction. This is a better record of the working capacity of our Pans than can be shown from the practical workings of any other for producing similar results, for the accuracy of which statement we refer to any of the mills where they are in use, a list of the principal ones of which are attached to this circular.

Our late improvements consist in having increased the size of the Pan, without adding to its weight, so that it may now be charged with 2,000 pounds of ore. This seems to be important, as it is the general opinion of those having them that it is preferable to work large charges, giving more time in the Pan for chemical changes, and to complete the amalgamation without at the same time decreasing the amount of work done daily.

We have also re-arranged our grinding plates and balanced our muller in such a way that the weight or bearing of the grinding plates can be regulated as required, the machine now evincing a greater degree of grinding capacity, which will enhance the amount of work that may be performed in a given length of time by each machine, as well as economize the power necessary to perform it.

HEPBURN & PETERSON.

San Francisco, March 20, 1865.

Description of the Amalgamator.

Two of the pans being in operation with one separator, each pan is to be charged with 1,600 or 2,000 pounds of coarse ore, as it is collected from the batteries; at the same time add sufficient water to keep it to a thick, pulpy consistency. You then take from the quicksilver bowl (attached to the separator) from five to fifty pounds of quicksilver, according to the character and richness of the ore, and add it to the pulp in the pans. The pans are then kept in operation until the reduction and amalgamation is complete—which time will vary from two to four hours, according to the character of the ore being reduced.

It is always best to regulate the working of the pans, so that one charge from the two pans working in conjunction with a Separator will be ready to be separated at a time, using one-half the time in the separating that is consumed in reducing and amalgamating.

After the ore is sufficiently reduced and amalgamated, the pulp is discharged into the Separator and the pan immediately re-charged without stopping the machine.

The Separator must always contain a sufficient quantity of quicksilver to fill the groove in its bottom, and have an additional overthrow of three or more inches each side of the groove. After the pulp is received by the Separator, it is to be thinned with water to a consistency that will allow the quicksilver and amalgam to precipitate and still retain sufficient body to keep the coarser particles of the pulp suspended in the water with the slum. This condition can readily be ascertained by placing the hand in the pulp when the separation is in progress. If the condition be proper, the pulp will be sufficiently thin to permit the quicksilver and amalgam to precipitate, and, at the same time, no perceptible difference will be felt in the consistency of the pulp from top to bottom; but if too much water be added, you will feel the coarser particles strike against your hand towards the bottom, as they are separating from the slum, and precipitating.

General Instructions for Using.

The accompanying engraving is a representation of Hepburn & Peterson's Amalgamator. The object of the inventors of this amalgamating pan has been to devise some means to obviate the inconveniences frequently met with in other pans, and arising from a tendency of the sands to pack when in a certain condition, as it becomes necessary to stop the running of the machine. Another desirable object was the production of a pan which would economize power and admit of the working of the sands in a more compact state, whereby the reduction is made to progress more rapidly, and amalgamation brought to a greater degree of perfection. Also to produce a machine that would do a greater amount of work, and be more simple and therefore more serviceable than those heretofore in use.

These objects Messrs. Hepburn & Peterson claim to have effected, in an important degree, by the peculiar construction of the bottom of their pan, which, as will be observed by the annexed illustration, is inclined toward the center, or shaped like an inverted cone—the dies being affixed to this cone-shaped surface, and the mullers made to correspond. The pulp being thrown into the pan, and the mullers set in motion, their action is such as to throw that portion of the pulp which finds its way between the grinding surfaces and the circumference, wheace, by gravitation, it descends to the center, and thence again beneath the mullers. A constant and active current is thus established, which cannot be done by the same motion when set in operation on a level surface. It will thus be seen that all necessity for wings or scrapers is obviated, which are oftentimes a hindrance to starting the pan after it has become packed from stopping, especially when it is coarse sands, but slightly advanced towards a pulpy consistency. There are no conditions, in ordinary working, where this pan may not readily be started without removing or thinning down the pulp, by simply elevating the mullers a trifle by a convenient set screw, as shown.

Messrs. Hepburn & Peterson have also a Separator, which is employed for separating the amalgam and quicksilver from the sands after the latter have been thoroughly reduced and amalgamated in the pans.—*Mining and Scientific Press.*

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Blanks.—We furnish Secretaries gratuitously with correct blanks for advertising assessment notices, delinquent sales, postponements, etc.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

REESE RIVER ORES.

If any person is disposed to doubt the existence of rich silver ores in Reese River, let him step into the store of J. A. Drinkhouse & Co., 228 Front street, in this city, and examine some of the specimens in his possession from various mines in that locality. We dropped in there a few days since, and spent some little time in looking over his specimens. More beautiful ores we have never seen. The ruby ore is especially observable, and although it is a very rare mineral in other localities, it forms quite a feature here. The chloride ores also occur in great abundance, and are very rich. Some specimens of this class, mixed with green and blue carbonates of copper, appeared to be exceedingly rich. These ores are only found near the surface. As the veins are followed in depth they give place to sulphurets and ruby ores, but, as surface indications, they are exceedingly favorable, giving evidence of a valuable mine below. The mines of Reese River are quite peculiar in character, and very different from those at Virginia City. They are not, as a general thing, very heavy, but are quite as reliable as those of any other locality on the Pacific slope. Their narrowness is a gain to the miner, from the fact that the mineral is more concentrated, no space being found for "horses," which appear to give our Comstock friends so much trouble, or from comparatively barren rock, the most of which must be passed through the mill, at a cost nearly equal to the value of the metal which can be extracted. Among the specimens which we noticed at the store of Messrs. Drinkhouse & Co., were the following:

From the Oregon Mill and Mining Company's North Star ledge we noticed some very rich specimens of sulphurets. This company own several valuable ledges. We were also shown several fine specimens from the famous Whitlatch lode, rich in chlorides and sulphurets.

Several specimens from the North Star proper, showing ruby silver, are also to be seen in the collection. Mr. Clements, of Austin, has left in our possession one of the finest specimens of ruby silver from this ledge which we have ever met with.

The Diana Company is well represented in this collection. Mr. Drinkhouse also showed us a most encouraging letter which he had just received from the superintendent of this company. A party intimately acquainted with the mine has offered to put up machinery upon it, and wait for his pay until he could take it out of the ore. Such an offer would indicate a most promising mine.

The Maggie; the Ethan Allen, now turning out good ore; the Camanche; the Revenue, rich in chlorides; the Southern Light, also rich in chlorides, and the Savage, showing rich sulphurets, are all well represented in this collection.

The Hubbard Company, an official report from which is published in another column, has also a number of specimens, carrying both chlorides and sulphurets. The quality of this ore may be readily seen by reading the report alluded to.

The district known by the general name of "Reese River" embraces a tract two hundred and fifty miles square, from the Humboldt mines on the north, to Death Valley and the impassable deserts on the south, and from Pine Wood and Clan Alpine to the State line on the east. We have ever, from the start, had faith in these mines, and we believe that nearly every intelligent person who has visited that region, whether as an expert or practical miner, has expressed a similar opinion with regard to their value and reliability.

TO START A BAULKY HORSE.—Fill his mouth with dirt or gravel from the road and he will go. The plain philosophy of the thing is—it gives him something else to think of. We have seen it tried a hundred times, and it has never failed.

We copied the above paragraph, a few weeks since, from an Eastern exchange. Three weeks after one of our friends and readers, in passing along Market street, observed a city "hus," with two incorrigible baulky horses in front, who refused to start a peg. A large crowd had collected around, when our friend and a companion stepped up, each to a horse's head, and amid the jeers of the crowd for their officiousness, they each stooped down for a handful of sand, which was placed well into the mouths of the animals. The horses soon found "something else to think of," and started off without trouble. The "jeers" of the crowd were promptly changed to "cheers" at the success of the manœuver. A few days after we saw the same thing tried, at our own suggestion, while we were riding after a span of baulky horses at Martinez. It succeeded to *our* satisfaction, although our companion, the owner of the team, was quite satisfied that they would have started "about that time" even if they had not been compelled to eat dirt.

IMPROVED HOSE COUPLING.—We would refer miners and others interested in the use of hose, to a new description of hose coupling, which is advertised in our columns by Messrs. Prescott & Scheidel, of Marysville, assignees of M. A. Winham, the patentee. This coupling is put together without any screw, being merely a male and female coupling brought together, and held in place by two clasps on opposite sides; one end of each clasp being held by a hinge, to one-half of the coupling, so that the other may be driven over an inclined nose or projection on the other half—by which means the two halves are brought firmly together and held in such a manner that they may be easily separated by a slight blow from a mallet, or pried off by a pick or any other pointed instrument. The patent also covers a fastening by a slotted bar, secured by means of key wedgee driven over lugs. The time occupied in separating this coupling is not one-quarter as great as that required for the couplings in ordinary use; while their cost is not more than one-third as much. The time lost in the slow and laborious work of coupling the heavy hose employed in hydraulic mining is much abbreviated by the use of this new invention.

TAYLOR'S FOUNDRY.—Mr. M. C. Taylor, of Grass Valley, has rebuilt his foundry, which was burned several weeks since. The new building is one hundred and fifty feet by thirty-six, and will contain a cupola of between 5,000 and 6,000 pounds of melting capacity.

ANCIENT BOOKS.—The editor of the Virginia *Enterprise* has seen, at the office of Mr. Janin, superintendent of the Gould & Curry mill, several ancient books, printed 200 years ago. They are in the Latin language, and are most elaborately illustrated. One is on mining, and shows that we are but little ahead of the ancients in many things. In passing there may be some difference in apparatus, but otherwise the processes in use to-day are almost precisely the same as 200 years ago. The ink used in printing these books is as bright and clear as when they first left the press, and the engravings illustrating the text are of a very superior order. These rare and beautiful books were procured by Mr. Janin in Germany.

ELECTRICITY.—The belting of machinery, as is well known, engenders a large amount of electricity. The Virginia *Enterprise*, in speaking of the new 300-horse power engine recently put up at the Gould & Curry works, says: "The belt is of rubber and is three feet in width. In dry weather a perfect shower of electrical sparks is thrown from this belt. Parties visiting the mill at such times amuse themselves by joining hands and trying electrical experiments. Quite a sensible shock will be felt by all in such a circle."

TO CORRESPONDENTS.—We are in receipt of a letter from our New York correspondent, Frank Wardell, which will appear next week. "E. J. P." sends us, for our next issue, something of interest to the copper miners of Mariposa. No. VII of "The Problem of Gold and Silver Extraction" has been received.

GALVANISM.—The discovery of this interesting branch of science, formerly called "animal electricity," is first noticed in a work entitled "The General Theory of Pleasures," published in 1780. It failed, however, to attract attention; and this new kind of electricity was left to be again brought into notice by Louis Galvani, professor of anatomy at Bologna. It appears that the wife of Galvani being in a bad state of health was recommended a soup made of frogs as a restorative, and some of these animals, skinned for the purpose, happening to be on the table in Galvani's laboratory, on which was placed an electrical machine, one of his assistants, in his experiments, by accident, brought the point of a scalpel in contact with a set of nerves of a frog, lying near the conductor, when the muscles of the animal became strongly convulsed. A repetition of the experiment, attended with similar effects, led to a regular investigation of the cause, an account of which was published by Galvani in 1791. In the year 1800, Volta made known his discoveries in connection with this branch of science, and it has been subsequently developed still further.

NEW USES FOR COAL OIL.—The uses to which coal oil may be put, besides being used as a burning fluid, are various. New discoveries and inventions for using it are daily made. The *Engineer*, a scientific and practical journal published in London, in the January number of this year, states that B. F. Stevens, of Trafalger Square, claims to have discovered three new and important uses of petroleum.

First—He claims a patent for the use of the vapors of coal tar, as chemical agents in coloring, etc.

Second—As an agent for roasting and smelting ores by the mixed vapors of coal oil mixed with air and steam.

Third—He claims to have obtained a strong motive power by the vapors of this oil, mixed with certain proportions of air and steam.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Discovery of the Plumbago and other Ledges in Southern Sierra.

Messrs. Editors:—I have heretofore promised to give you some information as to the causes which led to the discovery of the Plumbago ledge, which forms a prominent place in the quartz mining of south Sierra. It was first located by G. Maldonado, who has more recently figured in the Spanish lead at Virginia City. He commenced work upon it in the Spring of 1854. For some time previous, some miners had been working in what miners call a dry ravine, below the ledge, on almost bare bed-rock, with not more than ten or twelve inches of soil, at most. What seemed to be most surprising to the miners of those days was, where the gold came from; but Maldonado seemed to comprehend the fact, and therefore laid claim to the ledge immediately above where those men were finding such good pay. For lack of means, however, to prosecute his work, Maldonado, after expending several months' labor on the ledge, had to abandon the enterprise for the time. In February, 1861, Messrs. Fellows & Holly, considering the ledge abandoned, went, in the usual way, and located four claims upon the same ground on which M. & Co. had sunk inclines years before.

By one of those chances so common in all mining regions, the new locators did not sink *over twelve inches deeper* than the bottom of Maldonado's incline until they found good pay, and continued to take out rich ore until, at the end of two weeks, they had the snug little sum of *eleven thousand five hundred dollars*, all of which they worked in a hand mortar. A few months after they dug out two thousand dollars more, making $13,500. The present owners of this ground are Hoadley, Knight & Wheeler. The next set of claims is on the east of those just described, and are owned by Bales & Henry. They sluiced off about three or four hundred feet square below their ledge, from which they cleaned up $16,000. During the Summer of 1861 they also run a tunnel and took out some good-looking quartz.

The next set of claims is on the west side of the Fellows & Co.'s ground, consisting of 700 feet, at present owned by Briggs, Hagerty & Co. From these claims they have taken out $8,000 by a hand-mortar process. They have also taken out some 1,000 or 1,500 tons of very rich mill rock.

Adjoining this company, still further westward, is a claim of 300 feet, known as Amos Small & Co.'s claims, upon which a tunnel 180 feet in length tapped the ledge again, through which, in a few months, they took out rock from which they pounded out, by hand-mortar process, $13,000. During the same time, they took out about 300 tons of first-class rock.

The next set of claims, west of Small & Co.'s, are the Hope Company, who have 2,400 feet. They reached the ledge some time in November last. I am informed they have taken out over $20,000 the past few months; so that they are getting pay for two years' labor of running a tunnel through hed-rock, about 300 feet, before tapping the ledge.

The next set of claims west of the Hope Company is the Sacramento Company, who have 2,200 feet. They have also taken out several thousand dollars, but I am unable to speak positively as to the exact amount.

The general course of the ledge is north sixty-six degrees west, dipping to the north. It is in what is called a belt of serpentine. It is a well-defined ledge, standing at an angle of from twenty five to forty-five degrees; the under casing being generally very hard, and the upper quite soft. All that this ledge requires is sufficient capital to put the right kind of machinery up for working the rock, and I am certain that it will compare favorably with the best veins around Grass Valley.

I have already extended this communication to a much greater length than I at first intended, and will conclude by hoping that this may lead others to the discovery of similar rich ledges throughout the State. Miner.

Winnesota, February 18, 1865.

In Luck.—Two Germans left on the last steamer for their homes with the snug little sum of $50,000 each, which, it is said, they excavated from a rich pocket of decomposed quartz they discovered near Coloma, while out prospecting for enough dust to purchase a sack of flour, being at the time flat broke.

[Written for the Mining and Scientific Press.]

Working Gold Ores.

A proper knowledge of the laws of chemistry, philosophy and mechanics, involved in extracting or saving gold from the ores and gangues with which it is found associated, is of the greatest importance to all who are engaged in mining.

The principal amount of gold now obtained about Grass Valley is in the veinstone or quartz and sulphurets of iron, lead, zinc and copper. Chemical authors say that it is never found combined with any of the metalloids, forming an ore, but always in the metallic state, alloyed with metallic silver or copper, etc., to a greater or less extent, but never chemically pure. Pulverizing the quartz and earth, is purely a mechanical operation, and the best mode, whether by stamps, arrastras, or by centrifugal mills, is to be determined by the engineer constructing the works, and the mode of treatment to be followed after the ore is pulverized.

The affinity of gold and mercury to unite and form an amalgam is taken advantage of to collect the fine particles of the former as they are set free in the battery, by adding mercury from time to time in the right proportion, according to the richness of the ore, as the work progresses. Some put amalgamated copper plates in the battery.

After leaving the battery, the pulp and water pass over amalgamated copper plates of a length sufficient to insure the retention of all the free gold, or gold amalgam, that may pass through the seives. In this way it is claimed that ninety-five per cent. of the gold set free from the quartz and sulphurets can be saved without the use of blankets.

Another method is now being tried, called the Ryerson process, which consists in dry and very fine crushing of the ore by any means that may be adopted, then putting the ore into a wrought iron cylindrical tank, of capacity to hold half a ton, arranged with openings for the admission and discharge of ore which can be closed steam tight. The ore is introduced with a sufficient quantity of mercury and openings closed, when a jet of superheated steam is passed through a coiled perforated pipe in the bottom of the tank and continued as long as the operator thinks best; at the time we saw it in operation the steam was continued about five minutes, the cold water was introduced, the ore thoroughly wet down, when the lower valve was opened and the ore washed out into a wrought iron spout or bin above an amalgamated copper amalgamator.

The ore operated upon contained free gold, sulphuret of iron, antimony, zinc and silver, the sulphurets contained a portion of the gold enveloped in them mechanically. It is claimed for this process that the sulphurets are partially decomposed, the mercury vaporized and consequently placed in a condition of stronger affinity for the gold, so that every particle has its coat of mercury by which its weight is increased and the chances of its being obtained much facilitated. Does this method of manipulation bring about the chemical re-action sought? Let us state some facts and then draw our conclusions.

Mercury must be heated to 600 degrees of heat before it is volatized, which is 200 degrees above melted lead or a dull red heat. In order to derive any advantage from volatilized mercury in this operation, the whole mass of ore must be heated to that point; which would require more than five minutes. Doubts might be entertained whether it could be done at all with the apparatus now in use. The affinity of mercury for gold is increased as the heat increases, so that mercury heated nearly to the volatile point will dissolve coarse grains of gold or amalgamate it almost instantly into a paste; this method is used by dentists to form amalgam.

Superheated steam will oxydize iron sulphurets at a red heat, but not those of silver, zinc or antimony; so that in the above mode of working there can be no advantage claimed over the sulphurets.

The amalgamator used in this process is made with a copper bottom about ten or twelve feet long, about twenty-four inches wide, with rifles in the bottom to hold mercury; the sides are of copper, also about ten inches high and the whole set at a proper angle to give the water and sand a current; a lengthwise horizontal motion is given to it by an eccentric cone driven by the engine. I would suggest that the inventor has got his amalgamator wrong end up, and that it would do well to turn ends. Then it would not require any other motion than to have the ore equally distributed at the head, and to have it washed down by a proper current of water; the loss of mercury now sustained would be saved, as well as the power required to give it such convulsive motions.

Orlando Jennings.

Grass Valley, March 28th, 1865.

Letter from Markleeville.

Messrs. Editors:—Again I trouble you with a few lines from our Alpine hights. During the past few months the towns of Markleeville, Silver Mountain and Monitor have been comparatively snowed in, and it was with great difficulty that the inhabitants were enabled to pass and re-pass between the neighboring towns. But when we recollect that this is a new and thinly settled country, and that a general stagnation exists in every branch of business, caused by one of the most severe pressures of the times ever known on the Pacific coast, added to one of the hardest winters known to Californians, we should rejoice and be exceeding glad, that we have been enabled to weather it through as well as we have.

A brighter day, however, is now dawning upon us. The darkest hour is past, and we can sing:

"The Winter is past, the rain is o'er;
We feel the chilling winds no more."

The god of day is now making his regular trips, and we are enabled to bask our torpid souls in the cheering beams of his smiling countenance a few hours of each day; as he ascends, his chariot moves in the majesty of a cloudless sky, and he sheds his golden rays over hill and dale, mountain tops and valleys low. All nature seems animated, and life is visible in animate and inanimate things. I find music in all things around me, from the chirping of the cricket in the corner, to the roaming of our mountain streams, fed by the eternal snows of the Sierras. And while all nature is thus gladdened and made to praise the great Creator, I am not slow to believe that man, who is said to be "lord of fowl and beast," is entirely destitute of a spirit of gladness, for there seems to be a cheerful spark to spring up within the breast of every one we meet. The snow has all disappeared from the level ground, and vegetation is putting forth. Our old friends, who left these parts to spend the Winter in a milder climate, are fast returning, and everything in the shape of business is livening up. We are expecting a lively time in all this country during the coming Spring and Summer. The stages are already bringing in quite a number of strangers, and within less than a month they will pile in thick and fast. A new line of stages is to be put on this route soon, to run between Sonora and Murphy's, *via* Silver Mountain. By this line persons can travel from the California southern mines to the Virginia and Reese River country without being compelled to go by way of Sacramento. The route will be shorter, also, from San Francisco to Virginia than by any other route, and the traveler can have the pleasure of passing through this new mining region.

Our mines are doubtless good, but thus far we have no claims opened sufficiently to keep a mill running, save the Morning Star, of Mogul district. Some of the rock from this claim has recently been worked at the Pioneer mill, in this city, and given quite satisfactory results. From 445 pounds of ore, after it had been roasted by the Rivot process, a brick, weighing seven pounds and one ounce, avordupois weight, was the result—yielding at the rate of about $140 per ton, the greater part being copper. But copper or no copper, it is a handsome brick. The Good Hope, of Alpine, is driving ahead, and so is the Winchester, of Monitor. Several companies of Alpine and Mogul are going to resume work soon. By the way, we are going to have Eastern capital in our midst this year. Messrs. Thornton & Jones, of Mount Bullion, have sold a claim to capitalists in New York, who intend to expend $150,000 upon the ground this year. Sieron.

Markleeville, March 28, 1865.

It is said that many lives were saved at the recent Philadelphia fire by the device of pelting the upper windows of tenements with snow-balls, which, breaking the glass, awakened the inmates in time to make their escape, which a few moment's delay would have rendered impossible.

The opening of the Suez canal to navigate throughout its entire length, from the Red Sea to the Mediterranean, has been officially announced to all the chambers of commerce in Europe by M. Lesseps, president and superintendent.

[Written for the Mining and Scientific Press.]

Correspondence from Placer County.

Our correspondent, after alluding to the prevailing dullness of the times at Lincoln, Auburn and Illinoistown, continues and speaks as follows of

COLD RUN.

There are many people in this neighborhood. The mining is nearly all placer, and what is termed "hill diggings," worked on the hydraulic system. There is one mill in operation, engaged in crushing cement and gravel. The cement is an adhesive, clayey substance, which sticks to the gravel so tight that the common washing process has no effect on it. The mill is a very staunch one, of two batteries of four stamps each. It is owned by Messrs. Mallory & Co. They think it will pay very well. The mill is propelled by a very strong hydraulic pressure, brought to bear on a small wheel of some new pattern, and works admirably. As Mr. Mallory was not present himself, I did not learn the particulars. Leaving Gold Run, I proceeded to

DUTCH FLAT.

When nearing that place I could see large abrupt breaks and cavities in the sides of the hills, the effects of several years' hydraulic water power playing upon them. On arriving in town, I engaged board at the Dutch Flat Hotel, which I found to be a first-class house, kept by Mr. Seffens, a very agreeable and accommodating gentleman. In calling on the business men of the town, I met with some very agreeable gentlemen, among whom was Mr. Bradley, who took pains to tell me a great deal about the mines in that vicinity. Mr. B. showed some fine specimens of quartz from a ledge located some miles above Dutch Flat, between the Dutch Flat road and Henness Pass road. From an assay of some of the croppings of the ledge they have a fine prospect for rich quartz. It assayed $34.50 in gold and $10.80 in silver, with a small percentage of copper. There are other ledges located in that vicinity which will be worked in the spring. Before any very distant day Dutch Flat will probably hear the jarring and pounding of quartz mills, but whether that be the case or not, it will undoubtedly see better times in the future than it has for several years past, from the fact that the miners are going to be supplied with water all the year round.

A new ditch has lately been completed, bringing water all the way from the South Yuba, crossing Bear river on its way down. It is astonishing to see the extent of the ditches and flumes in the vicinity of Dutch Flat. The face of the country presents a regular network appearance, so many ditches and flumes crossing each other and running in every direction. W. H.

Iowa Hill, March 23, 1865.

How Shells are Cast.—The Petersburg *Commercial* says:—The shell department attached to the Fort Pitt foundry contains many curious and interesting things. The core of each shell is baked and varnished in the same manner as the moulds for casting the guns. One good moulder, with a helper, will cast from thirty to forty per diem of the 8-inch shells, and the establishment is capable of turning out on an emergency five hundred shells per diem. At present, however, they are only making about one hundred per day. Fifty tons of iron per week are used up in this department alone. Each shell, after being cast, is ground on an emery wheel, polished and hammered until it is perfectly round and smooth, qualities determined by gauges, which are made with such nicety as to detect an inequality of the four-hundreth part of an inch on the surface. The interior of the shell is also gauged to determine its thickness, which must be of an exact regulation—as, for instance, one and a-half inches in thickness for an eight-inch shell, and two inches for a ten-inch. For these shells, when finished, Government pays but six and a half cents per pound which is three and a half cents per pound less than is paid for a finished columbiad.

More Gold Fields.—Fabulous stories are again being told of the gold fields of the Amazon—a thousand ounces of gold having been taken from a single ton of earth, in that region, according to report. The Sacramento *Bee* says a gold excitement and a stampede in that direction within a year or two is not improbable. The thing is now being nursed. Eastern papers seem to feel an interest in the matter. It would be a nice thing for the steamship owners, as with the close of the war they will have a great many ships on hand.

The *Anti-Slavery Standard*, the leading abolition paper in the country, advises the disbanding of all the Anti-Slavery Societies, as the need for them no longer exists.

[Written for the Mining and Scientific Press.]

Mining in Calaveras County.

EDITORS MINING AND SCIENTIFIC PRESS :—A flying trip through the lower part of Calaveras county, has occupied my time for two weeks past. Although I saw much to interest a stranger, I had no time to spare while in the copper region to procure sufficient information to enable me to give a thorough description of the country through which I passed.

Prospecting has been almost entirely suspended; in some cases on account of the bad weather of the past winter, but generally for want of means to prosecute the work. I saw specimens of ore from several of the mines on which work has been suspended, which would seem to indicate that there was something below, if it could only be got at, but as money is scarce it cannot be developed just yet. Among these the "Acacia" and "Accorde," at Rich Gulch, near Jenny Lind, and the "Harlem" near Copperopolis, judging from the specimens they show, will some day be of great value. Several other companies that have not yet struck "pay ore" keep up their work in hopes of striking a lead, but whether they expect to strike it in their shafts or in the pockets of Eastern capitalists, I do not know.

But one claim in this county may be considered as having really paid expenses. The Napoleon at Telegraph City, and the Keystone at Copperopolis are furnishing some very good ore; but not, it is said, in sufficient quantities to pay for the expense that has been incurred in opening them.

There is some prospecting for gold quartz in this section, though but little has been done in that line as yet. A lead of decomposed quartz is now being worked by Austin & Hathaway, of Rich Gulch, which pays, in arastra, from fourteen to fifteen dollars per ton, while the cost of quarrying and milling is less than four dollars. This rock shows signs of containing copper, and the owners of the mine hope when they have reached a sufficient depth, to find a deposit of the latter metal.

THE ESPERANZA MINING COMPANY

Have opened a quartz ledge near Copperopolis, which they are prospecting for gold. The vein is from five to seven feet in width, the rock abounding in sulphurets, besides containing considerable free gold. Samples of this rock worked in San Francisco yielded at the rate of forty dollars per ton. A shaft has been sunk to a depth of fifty feet, revealing a large body of rich ore. The company are refitting the mill near the Salt Spring Valley reservoir for present use, but have ordered the necessary machinery for a large mill near the mine.

THE STANISLAUS MINE.

This mine, owned by the Melones and Stanislaus Mining Co., and located at Robinson's Ferry on the Stanislaus River, is one that has attracted much attention from the mining public, and deserves a notice here.

Through the politeness of the Superintendent, Mr. E. K. Stevenot, I was allowed to make a very thorough examination of this mine. The claim consists of 1,000 feet, but the work of the company has been confined to the north half; it has been opened to a depth of two hundred and fifty feet, and a length of four hundred. Gold, combined with tellurium, is found in shutes or chimneys, the great mass of the vein being barren. At a depth of sixty feet, a stratum of slate forty feet in thickness, dipping at right angles to the vein, cuts it off entirely, dividing the mine into two parts. Above this division there has been gold found imbedded in quartz, but in the lower part of the mine it exists only combined with tellurium in a matrix of feldspar. Three tunnels have been driven upon the vein, one under the other, the lower one being 100 feet below the upper. In the lower tunnel two shafts, 150 feet deep and 100 feet apart have been sunk, and connected by two levels at the respective depths of fifty and one hundred feet. A third level connecting them at the bottom has been commenced, and will be finished in a few weeks. The "main shute" of ore as it is called; as opened in the upper works of the mine, was about 120 feet in horizontal extent, and inclined to the southward at an angle of sixty degrees. In the lower works a similar "shute" of gold bearing feldspar has been discovered about forty feet in horizontal extent. A shaft was sunk some years since by some Mexicans, at a distance of 120 feet southward from the middle tunnel, to a depth of sixty feet, from which they took a large quantity of gold, but abandoned it on striking the stratum of slate mentioned above. This would seem to indicate the existence of a third chimney of rich ore.

In the working of this rock the dry-crushing process is used; though the present superintendent expresses his preference for the wet-crushing method, retaining the former only to save the trouble and expense of changing his machinery. Pan amalgamators have been tried and condemned, and amalgamation has been abandoned; the pulp being simply passed through a concentrator and the gold and sulphurets sent all together to New York to be worked by the "fire assay" process.

The concentrator used is an invention of the present superintendent, and consists of a wooden tub, such as is often used for arastras, in which a contrivance consisting of a horizontal beam containing teeth like an enormous comb, revolves with a speed of ten to fifteen revolutions per minute. This machine works very successfully here, and will, I think, prove useful in working any ores containing auriferous sulphurets.

Mr. S. is a very young man, being only nineteen years of age, but his management of the mine and mill, and his perfect and minute surveillance of every department of the work, would reflect credit on the most experienced miner in the State.

Leaving Robinson's Ferry on Monday morning, a trip of eight miles brought me to the town of Murphy's, the most lively camp in this county. This town is situated on the same limestone range as Columbia. The mining here is principally hydraulic mining, and will probably last some years yet, and judging from the manner in which prospecting is carried on we may hope that on its giving out, quartz mining will take its place. A small water mill is now being built below town by Spence & Co., for the purpose of testing the rock from several veins near the place which are believed to be rich. Three miles below Murphy's on San Domingo Creek is the

NOBLE COPPER MINE,

Owned principally by Pioche & Bayerque of San Francisco. Fine machinery has been erected on this lode for pumping and hoisting; a large shaft has been sunk and the prospecting has all been done in the most thorough manner. The work having been suspended for some time, the shaft, at the time of my visit, was full of water, and it was impossible to go into it, but Mr. Sloss showed me some very fine specimens of ore. If there is plenty of ore in the mine like these specimens, the owners have certainly a "noble prospect.

This place (Mokelumne Hill) and San Andreas, are both spending all their money in a lawsuit concerning the county seat, and while they are quarreling about this the placer mines around both are being worked out, leaving them poor, while if one-half of the amount was expended in opening the now undeveloped quartz lodes in this vicinity, permanent wealth would be developed worth more than the "whisky business" of half a dozen counties.

D.

Mokelumne Hill, April 1st, '65.

PHOTOGRAPHING THE MOON.—Mr. Warren de la Rue, by dint of enlarging and photographing his original image of the moon, has produced an admirable picture of our satellite, three feet in diameter, which is interesting alike to art and science. Especially as an aid towards further examination of the moon's surface, is it valuable; for, by means of it, an astronomer can study not only the actual appearance, but can establish points, for future comparison, using this great photograph as the test of changes which may yet occur in the moon. There is reason to believe that changes are taking place, and it is satisfactory that a means for verifying them should now be available.

PETROLEUM OIL IN ILLINOIS.—It is said that scientific geologists who have recently been examining the coal fields in the several States, have discovered oil in Illinois. It is found in Vermillion, Saline and Franklin counties, on the Kaskaskia, and in La Salle county, near Peru; also, on a small prairie called the Bull's Eye, in Mason county. The last named place is near the center of the State, between one and two hundred feet below the level of Lake Michigan, and it is supposed that the most extensive deposits of oil in the State are at that place, and not five hundred feet below the surface.

NEW INVENTION.—The Neveda *Gazette* says that Mr. Q. Rice, an ingenious mechanic of that city, has invented an apparatus for directing the stream of water in hydraulic mining, which is certainly a great improvement, and must be brought into general use. By its means a man or boy can manage the stream, turning it in any direction, and the pipe will remain as pointed, with the slightest support. The first trial of the apparatus was made a few days since at the fire-plug near the Union Hotel on Main street, and everybody who witnessed its operation was satisfied of its usefulness and importance. Another trial will be made soon in diggings near that city.

Report of the Secretary of the Hubbard Mining Company, Reese River.

The Hubbard claim, situated on Central Hill, Upper Austin, Reese River, contains 600 feet and is owned as follows: Henry Sharp, 125 feet; I. W. Credit, 150 feet; W. C. Gray, 100 feet; W. J. Conolly, 50 feet; P. Harrison, 25 feet, and C. A. Keyser, 150 feet. The claim was located in September, 1864, and the first pay ore was found some ten feet down, and yielded at the mill $586 per ton. The incline is now down 110 feet, with several side drifts east and west. The ledge varies from one to three feet in width. The highest assay per ton obtained is $6,607. So far, the working has been almost entirely from chloride ore. The company intends erecting hoisting works during the Summer. The following is a financial *resume* of the company's affairs, as obtained from the Secretary:

The company has had crushed and worked 54 1874-2000 tons of ore, yielding an aggregate of $18,541 75.

Assay charges and discount on bullion	$1,052 00
Mill charges	4,894 20
Expended for labor, tools, etc	3,946 90
Dividends	5,400 00
Balance in Treasury	3,248 65
Total	$18,541 75

CHS. A. KEYSER,
Secretary and Treasurer.

Austin, Nevada, March 28, 1865.

THE PROVIDENCE MINE AND MILL.—The Providence mine, situated on Deer creek, about two miles below this city, was located in 1857 by T. F. Dingley, Esq., and others. Since that time the company have expended over $60,000 in opening the mine and erecting a mill and other improvements. Since the mill has been in operation some $25,000 worth of gold has been taken out, and the balance of the expenditure has been paid by assessments. The company are now entirely free from debt, have a splendid mill of good capacity in working order, and have completed two tunnels, one 400 and the other 600 feet in length, into their mine, and on Thursday their ledge opened out to the width of four feet, the rock being very rich in sulphurets, and showing considerable free gold to the naked eye. The mill has been idle during the past Winter, but it will be started up on Monday to crush a small lot of rock, and the superintendent hopes to have it in permanent operation in a short time. There is every prospect that from this time forward the company, instead of paying assessments, will receive handsome dividends from the mine. The superintendent, Mr. Dingley, deserves great credit for his energy, perseverance, and faithful and economical management of the property, and we are glad to know that, as he is one of the principal owners, he is likely soon to reap a rich reward. His faith in the value of the mine has been such that he has not only invested in it several thousand dollars in cash, but his time and labor for the last seven years, and the result will doubtless justify his confidence. There may be richer mines in this neighborhood than the Providence, but there is none at this time in healthier financial condition, or with better prospects ahead.—*Nevada Gazette.*

ONE-LEGGED DANCER.—We clip the following from the Newburyport (Mass.) *Herald:*

We have heard of Donato, the one-legged dancer, but he is fully equalled in agility by a one-legged person of our acquaintance. This is a young man named Crocket, who lost a leg above the knee, on the Boston and Maine Railroad, when a child, who can perform feats with one foot, that few if any lads of his age in this neighborhood can perform with two feet. He will swim like a duck; he can run as fast as the fastest, bounding on like a deer, and his skating is marvelous. A dozen may start with him on the ice, but he is sure to come out ahead. Nor is it in a straight course alone that he shows his speed; with a crutch in one hand, and a skate upon the foot, he will defy them to catch him, and dodge as nimbly as a cat. We doubt if there is a boy that can jump higher. He leaps a fence that is as high as his head, and surprises his associates by standing back to a fence that will come to his shoulders, turning a somerset and coming down right end up upon the other side. It is very doubtful, had the two legs remained to him, if he would ever have developed so much spring and activity. He has made up in training what he lost by accident.

ANTIMONIAL SILVER.—In the Morning Star claim, Great Mogul district, Alpine county, California, pure antimonial silver, imbedded in white quartz, was struck last week.

To ascertain the value of greenbacks it is simply necessary to divide 10,000 by the price of gold and the quotient will give the value of greenbacks to the smallest transaction.

The Method of Sinking Oil Wells.

It may not be uninteresting to the reader of this to know a little about the manner in which the oil is drawn from the "dark depths of the earth." The person employed to sink a well, after exercising his judgment as to what spot of ground is most likely to be the covering of a mine of wealth, the "open sesame" of future uncounted millions, erects a derrick, and by force of steam drives an iron tube deep into the soil, until it strikes the rock. The drill is then introduced about two inches into the bit, which is firmly attached to an iron rod connected with the walking-beam of the engine.

These are the preliminaries; and then the real labor commences. The hole is then drilled day after day until the first stratum of sand is struck, which the driller generally does at the depth of about a hundred feet from the surface of the earth. At this depth, and in the third stratum, oil is sometimes found, but very rarely. After the right depth has been attained and the vein struck, the fact is soon announced by the spontaneous issue, with great vehemence of salt water mingled with oil and gaseous compounds. It sometimes happens that through accident the oil takes fire, and if such an occurrence he not followed by a blowing up of everything around, it burns with a dazzling lurid flame, very beautiful to behold. Cases are on record of the oil mingled with gas having been ignited by the fire of a cigar, when an explosion, resulting in severe injuries and even death to many by-standers, was the sad consequence.

The guerrillas at one time stumbling upon some wells in West Virginia, abandoned through fear of them by their rightful owners, by forcing the carbureted hydrogen and oil from a "flowing well" into the river, and igniting it, had the entire waters, if it may be so said, in a seething stream of lurid flames.

After "striking oil," the bore is, by the means of a "rimmer," rendered larger, when an iron tube, composed of small pieces of iron pipe, screwed together at every two or three feet, is placed in the bore and rammed down, at the same time being encased within flax-seed bags to separate it from the side of the bore, in order that the water from the soil along may not flow through the bore and be mingled with the precious contents of the vein below. The usual valve and piston used in common suction pumps being placed in the tubes and the sucker rod being made fast to the beam of the "iron horse," the whole business of preparation is at an end, and nothing remains but to set the whole machinery in movement, to be delighted with the sight of the wealth producing oil pouring in streams through the pipes conducting to the vessels arranged for its reception. —*Petroleum Review.*

THE AFRICAN SCORPION.—The Academy of Sciences has received a paper from Dr. Guyon on the mortal effects of the African scorpion's sting. Its scientific name (*Androctonus funestus*) indeed expresses that it is fatal to man, and yet Dr. Guyon states that perhaps out of 100 persons stung there is scarcely one dies of it. The ancients, who under the name of scorpion certainly mean the same insect, since it is found represented on Egyptian monuments and even engraved on precious stones, had a much stronger opinion of its deadly effects. Lucan, in his *Pharsalia*, B. IX., says, "Who would believe on seeing the scorpion, that it had the power of causing such a sudden death?" Leo Africanus states that the houses of Biskra are infested with scorpions, which are so venomous that death ensues immediately after the sting. Abd-Allatiff, an Arabian physician and traveler, says, "At Koos abundance of scorpions are found, whose sting is frequently mortal." Dr. Guyon knows of eight cases in which the sting of the African scorpion was followed by death; three of the sufferers were men, two were women, and three children. Two of the latter cases occured in 1856, near Laghonat, in Algeria. One was that of a boy nine years old, who was stung on the fore-finger of the left hand by a scorpion, which was seen and crushed on the spot. This occurred at eight o'clock A. M., and before noon on the following day the patient died. The sting had caused violent pain, increasing in proportion as the swelling extended to the arm. The boy cried a long time, and then vomited considerably. The swelling was in a great measure owing to the ligature which the Arabs always effect above the wound in such cases. The other case was nearly similar. Dr. Guyon states that children are more liable to die from the effects of the sting than adults, and that among the latter those who are stung somewhere on the head are most likely to die of it. —*Galignani.*

THE NEW MINING REGION.—One thousand claims are being worked in the new diggings lately struck on Wild Horse creek, in the Kootenai country.

At the present time there are some 1,800 laborers on the line of the Pacific Railroad from Newcastle to a point beyond Clipper Gap.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

San Francisco, Saturday Morning, April 8, 1865.

There is no perceptible change in the condition of the money market. An active demand still prevails in Bank and upon the street, but the requirement is not of sufficient urgency to affect the usual rates of interest for acceptable securities, or to impede the negotiations of parties in good credit. Five mining companies have paid dividends during the week, and disbursed in the aggregate the sum of $400,000 out of their net earnings for the month of March. The greater portion of this amount was paid to shareholders in this city, and less assistance has been required in stock circles from bankers and others for this reason.

Receipts of bullion from the interior since Saturday last exceeded one million dollars. Gold bars are in full supply and dull at about 800. Silver bars are also plentiful and in less favor at from 1 per cent. premium to 2 per cent. discount.

The mining share market has attracted more attention this week than at any time since June last, and nearly all first-class shares continue to gather strength and to increase in popular favor. The substantial character of recent developments in a number of mines, together with the handsome dividends that are being regularly paid to stockholders are tempting parties to enter the market who have kept aloof for a long time. Buyers are now found who were formerly engaged solely in what has been regarded by them as a more legitimate and less speculative business. Prospective dividends equivalent to 4 and 5 per cent. per month, and the exciting arena of the Stock Exchange, however, furnish more pleasing allurements to some than can be found in the graver pursuits of trade and commerce, and considerable capital from these sources has been invested of late in dividend-paying mines.

We are requested to call attention to the inconvenience and embarrassment arising from the location of the transfer offices of several prominent companies in Nevada. The delay and difficulty attending a transfer of every share of this stock sold here from hour to hour, is a subject of universal complaint, and many transactions are frequently annulled because of the trouble and time required to obtain certificates in the names of the parties purchasing. There are many other good reasons why the transfer offices of all mining companies, whose stock is actively dealt in here, should be located in San Francisco.

City stocks are steady and for the most part well held. California Steam Navigation is in much better favor at 73 per cent. bid, 74 asked. City railroad shares are inactive at quotations. The net receipts of two of these companies—the Omnibus and North Beach & Mission—are sufficient at present to pay regular dividends of ½ per cent. per month on their capital stock, and about 1¼ per cent. on the amount paid in.

Spring Valley Water Company was sold to the extent of 170 shares at $51. The Lake Honda reservoir is now completed, and holds about twenty million gallons of water. Work upon the dam on Pilarcitos creek, 30 miles from the city, is being vigorously prosecuted, the superstructure of which is already finished. The dam will be completed during the present year, and is to contain *one thousand million gallons* of water—more than one year's supply for the entire population of San Francisco. The company will pay their first dividend of of ½ per cent. on the par value ($100) of the stock in May next, and expect to continue these dividends monthly. They effected a sale recently of 17 miles of surplus pipe (formerly used by the Bensley Company) to the San Francisco Gas Company, for the sum of $80,000, and their affairs are believed to be in a flattering condition.

Legal Tender Notes have been largely dealt in, opening at 61⅝c, dropping to 59, seller 30, advancing to 66¾, receding to 64½, seller 30, rallying to 67c, buyer 30, and closing at 67½ bid, 67¾ asked. The sales during the week amount to $659,000 par value. Latest telegraphic advices from the East quote gold at about 155. Recent military successes were, it would seem, fully anticipated and accurately discounted some time since in Wall street, and the cause of the decline then from 200 to 147½ is now made apparent.

Yellow Jacket is in less favor, and steadily declined from $2,570 to $2,210, ex-dividend of $100 per foot, paid on the 5th inst., closing at $2,250 bid, $2,275 asked. A streak of valuable ore, some four feet in width, has been met with recently, most of which, it is said, assays $2,000 per ton. Other portions of the mine are looking well, and the net product of the current month promises to equal that of last month.

Savage continues to improve, and was sold at from $2,005, dividend on, to $1,985, ex-dividend, and still further advancing to $2,050. Within this range 16 feet changed hands. Advices from the mine are flattering. In opening an air shaft from the east chamber to the surface a large body of fine ore has been found. The lode at this point appears to dip east and south, and at this angle shows a deposit of ore 90 feet deep, with a perpendicular depth of some 70 feet.

Gould & Curry rose from $2,010, ex-dividend of $75 per foot, to $2,040, receded to $2,025, and closes at about $2,030 asked. The upper portion of the mine is looking still better, and now affords a very substantial refutation of the idea entertained by some a short time since that "this claim was on the eve of exhaustion!" The aggregate product in bullion for the month of March was $200,000, forty-five per cent. of which was distributed among the shareholders. The D street shaft has attained a depth of 400 feet, and this is to be continued to a depth of 1,000 feet, with prospecting drifts running east and west, a distance of 100 feet each.

Belcher has been in decided favor, and rapidly rose from $1,550, ex-dividend, to $1,900, closing at $1,730 bid, and $1,740 asked, within which range 31 feet were sold. In running a drift north, at a depth of 300 feet from the bottom of the shaft, a mass of splendid ore has been found, some 40 feet below the present working level. A feature of the ore met with in this mine is its value in gold, only about one-half of the yield being silver.

Crown Point is inactive at $1,350. The new hoisting apparatus will, it is thought, be in operation at the close of the month. Receipts of bullion for March amounted to $33,000, and this company have now a surplus on hand.

Potosi has been very largely dealt in, advancing from $1,020 to $1 300, buyer 30, receding to $985, rallying to $1,030, dropping to $900, and closing at about $855, at which rates 282 feet were sold. The progress of the suit of the Chollar *vs.* this company, now pending before Judge Mesick, has excited some interest, and at this moment an impression prevails that the case will be allowed to go before a jury on its merits. Law points are to be argued to-day.

Chollar advanced (mainly owing to the causes above alluded to) from $760 to $900, and closed yesterday at $905. In all, 282 feet have changed hands. Drifts are under way to the east and west in the fifth level of this mine, and some good ore is now being obtained from the fourth level in the south mine.

Ophir declined from $550 to $510, and rose again to $550. Hale & Norcross rose from $420 to $472½, and receded to $450. An assessment of $50 per foot has been levied. Empire Mill & Mining Company was sold at $450 and $475 per share, buyer 30.

Uncle Sam rose from $300 to $330, fell to $300, rallied to $327, again dropped to $300, and closes at about $305, at which rates 155 shares were dealt in. The long pending litigation between this company and the Overman is settled at last. A new company, called the Overman Gold and Silver Mining Company, has been incorporated in this city with 3,200 shares which will be issued share for share to the holders of Uncle Sam and Overman stock. The Trustees of the new company are Thomas Bell, Wm. Sharon, W. W. Stow, Richard Newby and James J. Robbins. The new company will assume the entire indebtedness of both the old ones, and it is believed that this can be very soon liquidated out of the yield of the mine, now that it can be worked without fear of lawsuits and injunctions. The yield of the last crushing of 150 tons from the Uncle Sam mine was $52 per ton, and equally good ore has been found in the Apple ground immediately adjoining the Overman on the north thus developing the vein for some 600 feet at a depth of 400.

Imperial was sold at from $198 to $202½, dividend on, and then rose from $192½, ex-dividend of $10 per share to $212, closing at about $212 asked. Some 120 shares were dealt in. Explorations below the old level are regarded with much favor and promises a large yield of good ore for some time to come.

Low priced shares of openly speculative character have attracted but little attention this week and we refer to the usual quotations in another column.

The aggregate sales of Stock and Legal Tender Notes since Saturday last, amounted to $1,325,467.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD.

Saturday, April 1.

12 shs Ophir at 550 per foot

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

Office of the Mining and Scientific Press—Nos. 11 and 56 Government House, corner Washington and Sansome streets, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment Act of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or palo ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, by which search, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of completing and procuring the papers, documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively smal

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforhand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a let-

ter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner: that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 y'rs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a reissue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief 20	
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunc tion from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, Government House, corner Sansome and Washington streets, San Francisco.

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEE and SHAREHOLDES, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

6th. Our "Shareholders' Directory" forms a complete Index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important and future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

REPORT
Of the Purissima Creek Petroleum Company's Oil Lands.

The claim of this company is situated partly on a fork of the creek above named and partly on Lobitos creek, upon land known as Oakley's Ranch, in the Coast Range, about three miles from the Pacific ocean, near Half-Moon Bay, in the county of San Mateo. Its distance from San Francisco by land is about forty miles, south, and by water about twenty-five miles. The nearest landing on the Pacific to this claim is that of Puri-sima, only three miles distant. A good county road runs near the ranch and along the creek to this landing. The owner of the property ran a tunnel, about a year since, at the base of the mountain, facing the ocean, on the west, a distance of one hundred feet, with the view of discovering coal. Having determined satisfactorily, by thorough examination and a chemical test, that, instead of coal, petroleum must exist at no great depth in this locality, the present holders employed a competent mineralogist and practical miner to visit their claim, and report his observations and conclusions upon the same. His report, with a sketch of the property, and all documents necessary to a full understanding of its value, accompanies this statement.

The owner of these lands, as will be seen from these documents, has vested in Mr. C. W. Curtis, his heirs and assigns, by deed, the right to enter upon and work them indefinitely for all minerals producing oil, reserving only one-tenth of the proceeds as a consideration. The facility of working, by boring or otherwise, ease of access by good roads, abundance of water and timber, and the vicinity of landings upon the coast, make this claim at least equal in interest and prospects to any other; the ranch covers one hundred and fifty-seven acres, mostly fine arable land, pasturage, etc. There is a good dwelling, a number of outbuildings, blacksmith shop, etc., on the property, which can be used by parties developing its mineral resources. The distance from the dwelling house to the base of the mountain, or to the mouth of the tunnel, is not more than one hundred and fifty feet. Messrs. Oakley and Hurtis ran this tunnel to its present distance, in the hope of discovering coal suitable for fuel; and on finding unmistakable indications of petroleum instead, Mr. Oakley concluded to allow parties desiring to prospect for oil the privilege of doing so at their own expense, reserving to himself only the guaranty before mentioned. The entire premises have been most thoroughly examined, and two distinct and separate tests obtained from the mineral deposits found, rendering it positively certain that not only the surrounding hills, but the level lands tending toward and lying contiguous to the ocean, in this vicinity, are saturated with emanations from extensive reservoirs of oil beneath. For further evidence in support of this statement, we refer to the mineralogist's report, and to the certificates and affidavits which accompany the same.

The surface of the country is hilly and undulating, and the entire ground comprising the ranch slopes gradually toward the ocean and toward the water courses. It contains many hollows or basins between the hills, of several acres in extent, some of them lying much below the average level of the ranch, and in favorable situations for boring with great advantage.

MINERALOGIST'S REPORT.

Messrs. C. W. Curtis and O. B. Oakley:—Having been requested by you to examine and report upon certain oil indications, on the Oakley ranch, San Mateo county, I proceeded to the locality described, a few days since, and made a thorough exploration of the entire ground, and of much of that in the vicinity, and herein submit the conclusions I have made from these observations.

An examination of the tunnel, which has been run at the base of the mountain, disclosed the following facts: The upper or overlying stratum of rock is limestone, much disturbed and broken, running in irregular courses of varying thickness above a very compact argillaceous shale, of a fine-grained, slaty structure, and of a color varying from a light drab to a deep black. Regular sandstone was found at a lower level, and on the banks of the present water courses, in abundance. These tertiary geological formations afford sufficient encouragement to the prospector seeking for either coal or petroleum, but especially the latter; and I was therefore not surprised to find these indications confirmed by subsequent explorations. For, not only does the bituminous shale exhibit, in color, touch and smell on being ignited, as well as in the intensity of the heat with which it burns, all the characteristics of petroleum, but the overlying deposit of limestone, and much of the surrounding detritus, and all the springs and streams of water flowing through the soil of this locality, were found impregnated and incrusted with the oil and its residuum. In the seams and crevices of the disturbed strata in the tunnel are incrustations from a sixteenth of an inch to an inch in thickness, of a black, tarlike deposit, shining and brittle, which, and being exposed to heat, boils and bubbles, an gives off a bituminous odor. This is the volatilized residue of the oil which has reached the surface through the porous shale by capillary attraction, hardened by long exposure to evaporation in the atmosphere. In other portions of the tunnel, at a greater distance from the surface, a thick, oleaginous exudation is still going on, of the same bituminous substance. The argillaceous rock taken from the tunnel, which has remained exposed outside from ten to twelve months, is volatilized of much of its oil, and bleached to a bluish white on its surface; on breaking it, however, the cleavage surface still shows an oily and sometimes resinous appearance. On placing a piece of the calcareous wall-rock in the fire, the oil *fried* out in black, tar-like bubbles, all over its exterior.

One noticeable feature of the rocky formation in this part of the Coast Range, is the finer quality of the oil rock or bituminous shale, compared with that of some other portions of the State. The clay-slate of Los Angeles and Santa Barbara counties is coarser and more porous, and better suited for conducting to the surface the denser form of asphaltum. The sand-stone of Mount Diablo and of Mendocino counties is also saturated with a thick bitumen, closely resembling the asphaltum of the lower coast. The purest and most easily volatilized oils, however, will be found where the finest and most compact oil-bearing rock is also found; for only the most refined portions of the oil could permeate such rock and reach the surface through it. It is well known that the most volatile oils are the most rapid in combustion, and in intensity of heat and light exceed the denser and less pure qualities. Some oils are of more value as lubricators than as illuminators; and as a fine quality of illuminating oil may also be valueless as a lubricator, it becomes necessary to determine how much of either quality is possessed by the different varieties of oil produced from the petroleum of different localities.

It is said that petroleum has been found in the Mount Diablo foot-hills, which will yield a fine quality of lubricating oil, that will not volatilize except at a very high temperature. It is certainly a strong confirmation, if true, of the remarks above made, and it follows, consequently, that the best illuminating oil will be found where the best lubricating oil is not, namely: beneath a rocky formation of so fine a quality that volatilization must necessarily be slow.

Not the most insignificant consideration should be the cost of refining the denser oils, compared with that of preparing those which Nature has partially refined for us. The petroleum operators of the Eastern cities are solely guided, in their judgment of different localities, by the percentage of refined oil which a given quantity of crude petroleum from any of those localities will yield. It will therefore be seen that those oil lands which are found to contain the purest and most volatile oil will bear off the honor and the profit in the coming extensive explorations that are sure to take place.

The object of the foregoing digression is to call your attention to the fact that the geological evidences in your claim encourage the belief that an extensive deposit of petroleum, suitable for illumination, exists in that locality, at a depth of not more than three to five hundred feet. There are several large basins, or deep depressions, below the tunnel, which would be favorable points for boring. I should have before noted the fact that the mountain in which your tunnel is situated exceeds in altitude above the sea any others in the Range for miles around.

On each side of the dwelling, north and south, and but a short distance from it, is a sulphur spring, strongly impregnated with the minerals of the surrounding soil, and the water of which is thus rendered unfit for use. On the surface of both of these springs appears an oily scum of a bluish tinge, showing that the soil through which these springs flow is full of the emanations from an oily deposit below. Much of the soil about the dwelling, and on other parts of the ranch, bears large patches of black residuum from the volatilization of oil at the surface, which looks as though the ground were constantly wet. The residents on the main creek also testify that the water bears on its surface, during the heat of Summer, much of the oily blue-tinged scum before mentioned.

There is a pure spring, however, which issues from another part of the mountain, and which does not contain perceptible quantities of either sulphur or carbonic acid gas; yet the water of this spring also, on being held toward the sun, exhibited the same kind of round oily patches of blue scum.

It must be borne in mind that this examination has been made in the cold and rainy season, in the month of March, when the streams are high, and when the evaporation of oil must be much less than during the dry and heated Summer term.

Notwithstanding this fact, sufficient evidences appear, even on the surface, to establish the belief that there is an abundant and inexhaustible supply of petroleum in your claim.

The beds of asphaltum in Santa Barbara and Los Angeles counties, which are the residuum of extensive oil springs, are mostly in level and low plains, or deep depressions of the foot-hills, and are more than six degrees further south than this locality; so that the Summer sun has there a much greater effect upon those deposits, and the volatilization and attraction to the surface of the denser oil is more extensive than in a colder region. Added to this is the fact that the overlying rocky strata are of a coarser and more porous structure; and we have here the two most cogent reasons for the more rapid evaporation and more extensive deposit of residuum at the surface in those localities.

The springs in your claim, however, being of a finer oil, and more quickly volatilized, even in a colder region, yet leave comparatively little residue, and that of a shining black color, and brittle fracture, while the crude asphaltum of the lower coast is of a dead black color and very tough. The resinous deposits found in all parts of your claim are conclusive proofs of the existence of petroleum of a better quality than any that has hitherto been found in the asphaltum districts.

Bituminous shale has been mined in England for many years, for the purpose of distilling therefrom the best illuminating oil, and the making of candles called paraffine; and the fact that even this process of distillation has been found profitable enough to warrant the investment of large capital, shows conclusively that when the petroleum itself is reached by boring through the shale, the results will be similar to those already realized in Pennsylvania.

When it is considered that the lighter and more quickly evaporated portion of petroleum is hydrogen, and that this is the identical gas manufactured from coal in our cities, and burned in our streets and houses, another use of this incstimable natural production suggests itself, which will call upon inventive genius for new and more economical methods of manufacturing an illuminating gas directly from the crude forms of illuminating oil, instead of from coal in any of its forms. I have devoted much thought to this branch of the subject on account of its relation to the value of oil lands, and especially of those which are now or will soon be in the market for the investment of capital to aid in their development. Enough has been said, however, in this connection, to draw your attention to the confirmation afforded of the opinion with which I commenced these desultory remarks, namely: that your claim presents all the required evidences of an extensive deposit of first-class petroleum, not far from the surface.

A quantity of the products of your tunnel has been subjected to analysis by distillation, in the hands of Mr. Gideon E. Moore, analytical chemist of this city, and the result is a fine quality of petroleum, which yields a fair percentage of refined illuminating oil, and also a considerable quantity of lubricating oil. This result is herewith submitted, along with his certificate as to its correctness.

W. H. Manning, Mineralogist.

The Precious Metals in India.—Of late years, but especially since the discovery of the gold of California and Australia, the importation of the precious metals has greatly increased, arising wholly from the increased prosperity of India. The reader may judge of this increase by the value of our own imports from that country at two not very remote periods. In 1854 the value of our imports was but £13,000,000, and in 1862 they had risen to £39,000,000, or in eight short years had been multiplied three-fold. In the last named year the value of our exports to India was but £17,000,000, and even adding fifty per cent. to this sum, so as to approximate it to the India value, the whole will only amount to £25,500,000, making a difference in the value of the imports and exports of $13,500,000, to be balanced by a payment in specie which accounts for the millions exported yearly to India. There the money is not hoarded or buried or expended in trinkets; but, with trifling exceptions, it finds employment in new branches of industry or the extension of old ones.—*Examiner.*

Sterrometal for Guns.—A letter in the *London Times*, from a distinguished English metallurgist gives some interesting particulars respecting the new gun metal lately invented in Austria by Baron von Rosthorn. He says: The new alloy, which has received the name of "sterrometal," from a Greek word signifying tough or firm, is composed of copper, spelter, iron and tin, in proportions that may be slightly varied without much affecting the result. In color it resembles brass rather than gun metal; it is very close in its grain, and free from prosity. It is possessed of considerable hardness, and will take a very fine polish. Several eminent Vienna engineers have tried it for the cylinders of hydraulic presses with great success. The writer gives it as his opinion that the days of wrought iron are numbered, and that its place will be soon supplied by steel in some form or other.

San Francisco Prices of Copper Ores.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

				Per ton							*Per ton*
12	per cent.	ore		$24 00	22	per cent.	ore				65 35
13	"	"		26 50	23	"	"				69 10
14	"	"		33 00	24	"	"				72 90
15	"	"		37 50	25	"	"				77 20
16	"	"		40 80	26	"	"				80 70
17	"	"		45 10	27	"	"				85 00
18	"	"		49 40	28	"	"				89 10
19	"	"		53 70	29	"	"				93 25
20	"	"		58 00	30	"	"				97 50
21	"	"		61 70							

To calculate the value of ore which assays 30 per cent. and upwards, multiply the per centage by $3.25, and you have the price which will be paid. For instance—suppose you have ore which assays 35 per cent.—multiply 35 by $3.25, and you have $113.75 as the value of the ore. These prices, we believe, will be found substantially correct, and can always be realized.

Now in Its Tenth Volume!

—THE—

Mining and Scientific Press,

—THE MOST—

Profitable Newspaper

—FOR THE—

Readers of the Pacific Coast.

Issued Every Saturday Morning.

DEWEY & CO., Publishers.

Our Journal enters its Tenth Volume with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

We believe that the Press furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the Mining and Scientific Press substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,

An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders.
A Faithful Monitor for Stockdealers,

An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to all Industrial Classes

Upon the Pacific Coast. We shall give accurate and frequent illustrations of new machinery and inventions.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; thus appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

☞ Bound Volumes For Sale.☜

C. W. M. SMITH.....W. B. EWER.....A. T. DEWEY

To Mining Secretaries.

We positively refuse hereafter to receive advertisements of any mining company for the payment of which the Secretary is unwilling to vouch. We shall also exercise the right to eject from our columns, at any time during the course of publication, any advertisement for which payment is not made, or security given upon proper notification.

DEWEY & CO.,
Publishers Mining and Scientific Press.

Register your Letters.—In remitting cash for subscriptions to the Mining and Scientific Press, our patrons will please register their letters, and we will then be responsible for their reception. Parties remitting without registering their letters will do so at their own risk. The fee for registry is twenty cents, for which a receipt is returned by the Postmaster to the sender from the party receiving the money.

Mining Press.—The San Francisco *Mining Press* has entered upon its tenth volume, and bears evidence of increasing prosperity. Dewey & Co. have, by untiring industry, made the *Press* one of the leading papers of the State, and as a mining journal it has no superior in the country. Those interested in the mines on this coast can make no better investment of five dollars than by subscribing to this excellent journal.—*Alpine (Markleeville) Chronicle.*

Particular Notice.—Whereas Julius Silversmith persists in announcing himself as "late editor of the Mining and Scientific Press," we wish it distinctly understood that he has had no connection whatever with this journal for the past two years, or since it assumed its present form; nor has either of the present proprietors ever been, in any manner, associated with said Silversmith.

A Strict Neutrality.—Our British friends have given us an additional proof of their amity. Three hundred blockade-runners, having had their fun spoiled by our cruisers, are observing a profound neutrality in the port of Nassau.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Saturday Morning, April 8, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Wm. R. Bradshaw—San Joaquin, Calaveras, Merced, Tuolumne, Stanislaus and Mariposa counties.

Mr. Robert Lattimore—Butte and Yuba counties.

W. H. Laws—Placer and El Dorado counties.

Thos. Poyzer, of Grass Valley, for Nevada county.

SAN FRANCISCO CORDAGE FACTORY.

One of the most important and useful among the leading manufacturing establishments on the Pacific Coast is that of the "San Francisco Cordage Factory." This company commenced business in 1856, and have successfully prosecuted the same from that period until the present, under the active and energetic direction of Messrs. Tubbs & Co., of 613 Front Street. The works of the company are located in a most delightful valley on the westerly portion of the Potrero, having an ample water-front, with a wharf franchise running out into the deep water of the Bay. The quality of the cordage manufactured by this company will bear favorable comparison with any imported article which has ever been offered in this market. The enterprise was started as an experiment, with the view of proving the practicability of producing, in California, an article of prime necessity for our leading industry; thereby giving permanent home employment for capital and labor. The fact that the company has been compelled, from time to time, to enlarge their works, to keep pace with the increasing demand for their manufacture, affords the best evidence of the success which has attended their efforts. The latest and most important enlargement and improvement has just been completed, and the San Francisco Cordage Company Works now present one of the most complete and best arranged establishments on the continent. We took occasion, while at the Potrero, a few days since, to visit this establishment, and having thought that a full description of the same might be of interest to our readers, we give it as follows:

THE BUILDINGS AND DRIVING POWER.

The main or spinning building is of wood, one hundred feet by forty and two stories high. The rope walk attached is 1,000 feet in length, extending from the main building towards the water, and in a direct line with the company's wharf. It is in contemplation, whenever it may be considered advisable, to extend the walk out upon the wharf. The wharf franchise will admit of such extension 1,000 feet, which would give a walk 2,000 feet in length, if ever required. The boiler and engine house are of brick, the former thoroughly fire-proof, with iron roof and doors. The machinery is driven by a Corliss engine of 150 horse-power, with a twenty-three-inch cylinder and four-foot stroke. The main driving wheel is eighteen feet in diameter, with a thirty-inch face, running a belt 120 feet in length. The power is conveyed to the main line of shafting through a brick partition wall, into the spinning building, by which arrangement the engine is removed from danger from fire and kept perfectly free from dust. The engine is of a most beautiful and substantial make, having been manufactured especially for the Cordage Company in Providence, R. I. The principal peculiarity of this engine is the mode of operating the governor, which is made to act directly upon the valves of the steam chest, opening and closing them so as to admit just so much and no more steam, at each stroke, than is necessary to drive the piston through that stroke. The valves are oscillating, and the steam is worked expansively. The economy in the employment of steam by this engine is thought to be unsurpassed by any other make. The mason work upon which the engine is placed is of the heaviest and most substantial character. The engine is in charge of Mr. William Anderson, under whose supervision it was put up. Three boilers are employed for making steam, each sixteen feet long and fifty inches in diameter, constructed with forty-two three and a-half inch tubes in each. They were made at the Pacific Foundry.

THE BOILER FURNACES

Were set by Mr. Joseph Stansfield, who had the entire charge of the construction of all the mason work. The manner in which he has fulfilled his trust reflects the highest credit upon his skill in his especial department. Everything is neat and compact. The draught is perfect and could not be improved, although the location (being half surrounded with hills) is very unfavorable. The fire chimney is constructed of brick, and is a fine piece of work eighty-five feet in hight and well proportioned. The furnaces are so arranged as to consume all the smoke and gases arising from the coal. This is accomplished by the peculiar arrangement of the draft, by which a current of cold air is allowed to come in contact with the gases, just beyond the bridge-walls. The economy of this arrangement is considered very important. The arrangement is peculiar with Mr. Stansfield. We have seen a certificate from the engineer of the Bensley Water Works Co., whose boilers were also set by Mr. S., in which it is stated that this mode of setting boilers has effected a saving to that company of $30 per day in fuel. This calculation has been made after a trial of sixteen months. The furnaces are so arranged that any one can be taken down and repaired without interfering with the others. We have dwelt more particularly upon this matter from the fact that economy in fuel for making steam is a matter of great importance in California, and one to which quite too little attention has been paid. Whenever we see dense volumes of black smoke coming from the chimneys of boiler furnaces we always know that there is something wrong about them, and that the boilers were not set by Mr. Stansfield. The peculiar manner of setting furnaces and building chimneys, by which the above results are obtained, is not known to any other man in California, than Mr. S.

THE RAW MATERIAL.

The raw material used by this company in their manufacture, is exclusively that which is known in commerce as "manilla." This is not a species of hemp, as many suppose, but it is the wood fiber of a tree, which is allowed to grow about fifteen feet in hight and some six or eight inches in diameter. At this stage of growth the tree is cut down, and divided into convenient lengths and afterwards slit up into fine strips and fibers by a cutting blade, much after the manner of batcheling flax, only a single blade is used instead of a number of needles. The material is not "rotted," as is the case with hemp and flax, but stripped up in its natural condition and dried in the sun. The process is very slow and tedious, and conducted exclusively by natives. If a Yankee had it to do, his first step would be to invent a machine which might accomplish the work of ten or twenty men. The manilla is prepared in "hanks," much as flax is sometimes put up, and in that condition baled and shipped to a market. It is produced exclusively, we believe in the Phillipine group of Islands in the Pacific Ocean. One of the peculiarities of manilla is that it will not absorb tar, as does the Kentucky and Russian hemp. The tree or plant from which it is prepared is known to botanists as the *Musa textilis*, a plant allied to the banana.

The Company imports its raw material direct from Manilla to this port, and their convenience to the source of supply gives them a decided advantage over Eastern manufactures for this market. They have also the material advantage of being directly in the market, and knowing exactly what is needed, thereby obviating the necessity of keeping a large supply of unmerchantable goods on hand to meet occasional demands. They can also manufacture direct to order. As an instance, we would remark that the company received an order from Victoria a few days since, for a thirteen inch rope—an unusual large size—for a ferry rope. The order was answered by the next steamer; the rope went up on the steamer of Tuesday last.

THE DRAWING AND SPINNING DEPARTMENT.

We come now to the manufacturing process. The bales are received into the drawing room, where they are opened, slightly moistened with oil—the best Polar—to render the material pliable; it is then weighed into parcels of equal weight and placed in the "lappers," by which it is drawn out, and the fibers lapped or drawn together. Each parcel is passed through the lapper three times. It is then passed to the "drawer," where it is drawn out. The process of lapping and drawing is quite similar to those processes as employed in preparing cotton for the spinning frame. There are three sets of drawers, geared at progressive rates of speed, so that after the "lap" has passed through the last drawer it is ready to go to the "spinner," where it is twisted into a coarse yarn or "strand." The material, in the process of spinning, is wound upon a bobbin. The bobbins are now taken to the "layer," which is a machine for making small rope of all sizes and under two inches in circumference. Here the strands are "layed" into rope of six, nine, twelve, fifteen, eighteen, twenty-one or twenty-four strands or threads. There are seven layers in the establishment, each calculated to lay one of the above given number of strands.

In the drawing room there are eight lappers and seven drawers. The establishment has sixty spinning machines, about half of which are placed, with the layers, in the second story of the main building. A particular description of the machinery would extend this writing to a length altogether beyond the limits of a newspaper article.

THE ROPE WALK.

The larger classes of rope are made in the Rope Walk. The yarn, wound upon the bobbins, is passed from the spinning room to the "walk" by means of an inclined trough, which saves handling. Here the bobbins are placed upon upright spindles, arranged upon a frame work in such a manner that any desired number of yarns may be drawn off and twisted into a "ready," as they are called. A "ready" is a single strand of rope drawn off from the bobbins, twisted, cut to the proper length for the rope which is intended to be made, and "laid up" upon cranes, placed at intervals along the length of the walk. In taking these yarns from the bobbins they are drawn through conical holes or iron tubes, made in a thick steel plate, very much like those prepared for drawing wire. By this process the fiber of the strand is pressed closely together so as to make it hard and firm. The company has six hauling and laying machines, two of very large dimensions. The manner of working these machines, and laying up the rope is familiar to most or all of our readers. The two large machines were built here. The castings were made at the Pacific Foundry, and the machine put together and its wood work made at the machine shop of the company.

The largest size rope which has yet been made at this establishment was thirteen inches in circumference. They make and sell much nine-inch rope. That heretofore manufactured has been usually about 660 feet in length, but the increasing demand for longer rope for deep shafts, etc., is such that the company will soon add 500 feet to the present length of their walk. The chief demand for rope is for mining and agricultural purposes; about three-quarters of the sales are for that trade. Mr. A. L. Peach is head rope-layer and has charge of the Walk.

GENERAL REMARKS.

The number of hands employed during the day at the establishment is generally about forty-five, and thirty-five for the night-shift, about one-half of whom are Chinamen. The latter are employed to do the work generally assigned to boys. They are found to make very good hands. The company have several who have continued in their employment since 1856. The Chinese have a house built according to their own taste and design—the company furnishing the lumber. No rent is charged. They receive one dollar per day for wages and board themselves. The Chinese quarters are entirely apart from the dwellings of the other employees. Most of the other employees have little cottages of their own, built upon ground sold them at a moderate price by the company. These houses, with the company's buildings, form quite a little village. Everything around looks neat, tidy and homelike. It has been the policy of Messrs. Tubbs & Co., the chief owners and agents of the concern, to obtain good hands, pay fair wages and make as few changes as possible—encouraging their men to build up little homesteads for themselves and families. In all their dealings with these employees, they appear to adopt a liberal policy, calculated to keep up good feeling between employers and employees, and encourage the latter to take a personal and active interest and pride in building up the business, giving credit to the managers of the different departments when and wherever it is due. The example set by the Messrs. Tubbs & Co., in this particular, is worthy of much commendation.

The works have heretofore been running during the day time only; but have now started in on night-work, in order to meet the increasing demand for the manufacture. Fifty bales of the raw material are worked up each twenty-four hours. The greatest attainable degree of economy is observed in every department, and everything moves along like clockwork. Order prevails everywhere. A machine shop is being fitted up in a portion of the fire-proof engine house, where all repairs will be done under the direction of Mr. William Pedrick, head machinist, who is a master of his business.

Mr. W. L. Spinney has acted as general foreman of the works since their start in 1856. The arrangements in case of fire are already quite complete, but will soon be made much more so. There are four tanks, containing 5,000 gallons of water, placed at intervals upon the roof of the main building, with hose attached, and by which any portion of the works can be almost instantly flooded with water. Steam pipes will soon be arranged, by which the entire building, or any room, can be instantly filled with steam, upon the first appearance of fire—thereby insuring an almost instant extinguishment should a fire break out.

CHOLLAR *vs.* POTOSI.—This case, says the Virginia *Union*, is dragging its weary length along before Judge Mesick's Court. The Chollar company have examined Webb, under whose title they claim. He testified to a ledge location, and the Potosi refused to cross examine. The best legal talent in the State is engaged on either side. The suit involves about a million—more or less.

IT is said that greenbacks sent to this coast are now packed in safes, in charge of a guard, instructed to throw them overboard on the steamer being captured. The America took down a guard on her last trip, and all the Government funds now come *via* Nicaragua.

THE MOUNT DIABLO MINES.

CONTINUED.

In continning the description of the Mount Diablo mines, from our issue of the 26th March, we come now to the Summit of Zion Copper Mine, located on the extreme northerly point of the spur which reaches out from the main Mount Diablo, as described in a previous article, and upon its westerly declevity. The approach to the mine is from the west, and up quite a steep acclivity, up which, however, a good road might he constructed, with comparatively very little labor, from the level of the valley below. Some $4,000 (we write from memory) has been expended upon the mine, under the general direction of the Secretary, J. F. Williams, Esq., of Martinez. A tunnel has been run in so as to strike the vein at nearly right angles with its line of direction, which is nearly north and south. After passing through the vein, a few feet, so as to make sure of cutting it, the foreman went back and commenced an incline, the vein dipping directly under the tunnel, and in conformity with the slope of the hill. After following the incline some fifty feet in depth, (our distances are all written from memory and of course are only approximate), a drift was started to the right, and run northerly upon the vein, some twenty or thirty feet, the indications of copper in the meantime sensibly improving. The incline was subsequently driven downward some thirty feet further, to the water level, where another drift was started, also to the northward. This is all the work which has been done upon the mine, except to sink a shaft some fifty feet in depth from the croppings, to ascertain the probability of the existence of a vein in depth. This was the first work done upon the mine, and the development was such as, in the opinion of the directors, to warrant the commencement of the tunnel already described.

The work upon this mine has been most judiciously laid out, and we doubt whether another mine can be found in the State, worked by a company, where a better show has been made for the money expended. This is a most encouraging indication to the shareholders, and should be considered an additional inducement for them to continue the work of development so judiciously and economically conducted thus far. A careful examination of the mine, as now opened, has satisfied us that the company has a true vein, with well defined walls—both upper and lower. The foot wall upon the incline is almost as smooth and even as a floor, throughout its whole extent; the dip, however, from the first drift to the bottom of the incline, has taken a sharper pitch, which is an encouraging indication. The vein-rock is quartzose, carrying a large quantity of mundic. As the workmen have descended, the indications of copper have constantly increased, giving reasonable evidence that at a greater depth a concentrated vein of sulphurets may be looked for.

The vein was first struck in a depression, or gorge, between two ridges. It is seldom, especially in either silver or copper, that a concentrated paying vein is found immediately beneath such a surface. The managers of this mine have done well in running a drift along the course of their vein, in order to prove it in depth under the higher portion of the ground, because it is well known to miners that chimneys, or the more concentrated portions of copper and silver veins, are usually found beneath the elevated portions of the surface ground. If the same economy is practiced in future that has characterized operations in this mine heretofore, it will require but a small additional amount to prove its value.

THE LELAND MINE, ARIZONA.—We were shown a certificate of assay from G. W. Bell, of a sample of ore from the above-named mine, returning a result per ton of $82.95 silver and $735.55 gold—total, $818.50. We understand the lode is found from five to eight feet in width, standing nearly perpendicular. Arizona mines will soon be in greater favor, if we judge rightly. The Leland Company has an excellent Board of Directors, of whom Dr. Isaac Rowell is President.

THE CHAMBER DRILL.—This new and useful instrument seems likely to be adopted into use throughout the State. Those who have employed it thus far speak in the highest terms of the manner in which it works. We have seen certificates from practical miners, who are personally known to us, who have used it, and who state that with it two or three times as much work can be done as with the ordinary drill. This drill, as its name indicates, is designed to cut out a chamber in the bottom of a hole previously made by the common drill. This is accomplished by an ingenious piece of mechanism attached near the end of a piece of iron which, when placed in a drill hole, and being struck, as in drilling, throws out two cutters from its opposite sides in such a manner as to cut at right angles with the direction of the blow. By constantly turning this iron or drill, and repeating the blows, an enlargement or chamber is made near the bottom of the hole to receive the powder, which is thus made to give a lifting purchase on its explosion, throwing out from twice to three times as much rock as could be thrown from the same hole without being chambered. This is found to be the result in actual practice. Under such circumstances, we do not see what is to hinder this drill from coming into general use. Persons engaged in blasting will do well to call upon Mr. Isaiah Weston, at Nos. 4 and 5 Government House, in this city, where the drill can be seen. Orders from the interior may also be addressed to Mr. Weston, by whom they will be promptly answered. Messrs. Godfrey & Sherwood are the proprietors of the patent in this State, having purchased the same of Mr. Linscott.

THE LATTER RAINS, contrary to the anticipations and fears of many, are now upon us. During the last thirty-eight hours copious rains have fallen over pretty much or quite the entire State, and, as a consequence, the grass and grain, which had already begun to droop, have revived, and an abundant harvest is now considered a matter beyond a doubt. The rain has been most opportune, and has saved millions to the State.

A NEVADA INVENTION.—The Scientific American reports the patenting of an invention of W. F. Stewart, of Austin, of an improved mode of working silver ores and saving amalgam and quicksilver. Frank Stewart resided temporarily in this city about a year ago, and often mentioned that he had a process by which all amalgam and quicksilver that was then wasted could be saved. He never vouchsafed us an explanation; but we inferred that it was a chemical preparation. At that time there was great loss at the mills complained of by the miners, which, we think, does not occur to-day, although ores of the class worked then are worked now by nearly the same process, but cheaper. There is still some loss of quicksilver, and, without doubt, amalgam, which, probably, this invention may save; if so, and it can be done cheaply, Stewart can make the fortune we really wish him to possess. His residence, however, is San Jose, Cal., and not Austin. We think he would have brought his invention into notice much sooner by doing his patenting business through the office of the MINING AND SCIENTIFIC PRESS of San Francisco, rather than the Scientific American of New York. For that, he deserves a newspaper lick from some one. The MINING AND SCIENTIFIC PRESS is a paper that all citizens of the Pacific coast should be proud of, and those connected with mining particularly should give it their support. As a mining journal and instructor, it is far preferable to the Scientific American, although that paper leads all others in its specialty of mechanical engineering.—[Reese River Reveille.

Illegal Advertising!

We notice many Secretaries are having their notices of delinquent sales published *weekly* in a *daily* paper. As this is a plain violation of the new law we feel it our duty to warn such parties of this error, and herewith append that section of the "Act Concerning Assessments upon the Stock of Corporations," which governs the publication of delinquent notices.

Section 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows: When published in a daily paper, the same shall be published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to the day of sale, the first publication in the weekly being at least fourteen days prior to the day of sale.

By the above extract it will be clearly seen that no delinquent stock can be legally sold by advertising in a daily paper, unless the notice is inserted *daily*.

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Assessments and Delinquent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment; Date of Meeting, Delinquent Advertisement and Sale, and the Place of Business of the Corporation if it is not in San Francisco.

REVISED EVERY ISSUE.

Advertised in the Mining and Scientific Press AND OTHER SAN FRANCISCO JOURNALS*.
